Method of Inquiry. Secular humanism relies on the methods of science to test claims to truth. This is known as methodological naturalism, the cornerstone of modern science. Broadly conceived, it is the hypothetical-deductive method, in which hypotheses are tested by their experimental effects and predictive power, integrated into theories, and validated by their comprehensive character and mathematical elegance. The grounds of a hypothesis are open to anyone who can examine the evidence and the reasons for its support. These can be objectively corroborated by independent inquirers. On this interpretation, the scientific method is no esoteric arcane art available only to a narrow coterie of disciples; nor does it lay down fixed rules of investigation. Rather, it is continuous with ordinary common sense or critical intelligence, and it involves the controlled use of the methods of inquiry that are successful in other areas of life as well.

All human knowledge is fallible and all claims to ultimate or absolute truth questionable. Hypotheses should be taken as tentative, for even well-established principles may later be modified in the light of new evidence or more comprehensive explanations. Thus the scientific method entails some degree of skepticism, but this is not of a negative character, denying any meaningful possibility of knowledge. Quite the contrary, humanists believe that a significant body of reliable knowledge can be arrived at by scientific inquiry, and that thoughtful applications of science and technology can enhance the human condition. Secular humanists wish to extend the methods of science to all areas of human endeavor, in marked contrast to conservative believers who have often campaigned to block scientific research (see RELIGION IN CONFLICT WITH SCIENCE).

Secular humanism is receptive to a wide range of human experiences, including art, morality, poetry, and feeling. Indeed, it is inspired by the arts no less than the sciences. But it is unwilling to declare any belief as validated by private intuitive, mystical, or subjective appeals. Rather validation comes only through the tests of intersubjective confirmation. If intersubjective confirmation is not achievable, then the only reasonable position is to suspend judgment about the hypothesis until such time as we can marshal decisive evidence for or against it. Karl POPPER's nonfalsifiability principle (that a theory is admissible only if there are conditions under which it can be falsified) has been used against those who propose nontestable claims, particularly in the areas of the paranormal or religion (see FALSIFIABILITY; LOGICAL POSITIVISM); though others deny that such a line of demarcation can be so easily drawn.

Naturalistic Cosmic Outlook. Naturalists maintain that the universe is intelligible to human reason and explainable by reference to natural causes. This may be called scientific naturalism. The modern secular humanist outlook has been profoundly influenced by naturalism. It looks to the sciences in order to understand nature. What do today's sciences tell us? They describe a world in which physical-chemical processes, matter and energy and their interactions, and the regularities discovered by the natural sciences are primary in the executive order of nature. But nature cannot be reduced simply to its material components; a full account also must deal with the various emergent levels at which matter is organized and functions. Explanations are derived from various contexts under observation. We may approach this on the macro level by reference to our planet and solar system, or to the expanding universe or galaxies (or multiverses) discovered by astronomy, or on the micro level of subatomic particles observed by physics and chemistry, or by reference to organic matter in the biosphere explored by the biological sciences. This is sometimes known as "systems theory."

Ever since Charles DARWIN in the nineteenth century, evolutionary concepts have become central to our understanding of nature (see DARWINISM AND UNBELIEF). The theory of evolution seeks to explain the change of species through time in terms of chance mutations, differential reproduction, adaptation, natural selection, and other natural causes. This may very well be called evolutionary naturalism. Human behavior is thus understood by drawing from many sciences, including biology, genetics, psychology, anthropology, sociology, economics, and other behavioral sciences (see COGNITIVE SCIENCES AND UNBELIEF). The historical sciences help us to interpret the functioning of social institutions and human culture. Any "theories of reality" are thus derived from the tested hypotheses and from theories rooted in scientific inquiry, rather than from poetic, literary, or theological narrations, interesting as these might be.

Naturalists believe that we need to develop, if we can, interdisciplinary integrative generalizations drawn from across the sciences. The concept of "coduction" aptly applies. Contrasted with *induction* and *deduction*, this means that we *coduce* explanations that cut across scientific disciplines in order to develop a more comprehensive cosmic outlook. E. O. Wilson has used the term *consilience*, which he borrowed from the nineteenth-century philosopher of science William Whewell. In any case secular humanists need to make every effort to develop a "synoptic perspective," a summing-up, as it were, drawing from many sciences. Secular humanists believe

that it is important to convey to the public some understanding of what the sciences tell us about the universe and the place of the human species within it.

This generalized naturalistic theory avoids materialistic reductionism—the insistence that all phenomena can be explained by reference to first principles, as in the attempt to explain psychological or biological phenomena purely by reference to chemistry or physics. Rather, it encompasses two system-theoretical insights: that emergent phenomena appear at successive levels of complexity that cannot be explained simply in terms of lower-level phenomena, *and* that these nested systems of phenomena themselves constitute a natural phenomenon requiring new hypotheses and new theories appropriate to that level of complexity. A graphic illustration of this of course is the emergence of countless new species that Darwin discovered on the Galapagos Islands. Such an outlook does not threaten a naturalistic worldview because it supplements reductive explanations with higher-order explanations, while it does *not* make room for spiritual or mystical explanations. This insight also undergirds the capacity of secular humanism to respond to the living world in all its plurality, diversity, and richness, and it leaves room in human culture for science and social institutions, moral justice, and the arts. It also allows us to draw upon human intentions as telenomic explanations of complex psychological behaviors. This approach encompasses both consilience and systems theory. On this interpretation, coduction does not just stretch "horizontally" across disciplinary boundaries, as consilience does; it also stretches "vertically," encompassing the layers of emergent phenomena, from the micro level to the macro level. It is thus both interdisciplinary and intrasystematic.

This naturalistic perspective of the universe competes with the traditional theological outlook that postulates a supernatural realm, a doctrine of salvation, and an immortal soul, all concepts that scientific naturalists reject.

Nontheism. Secular humanists are dubious of any effort to divide nature into two realms: the natural and the supernatural. They find the classical definition of an omnipotent, omniscient, and beneficent God to be unintelligible, the alleged proofs for God's existence inconclusive (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST), and the problem of reconciling evil with presumptions of divine justice insurmountable (see EVIL, PROBLEM OF). Arguments from a first cause or unmoved mover are fallacious, for we can always ask, "Who caused God?" If that question is unanswerable, so also is the question: "Why should there be something rather than nothing?" Highly suspect are the postulations of "fine-tuning," "intelligent design" (see INTELLIGENT DESIGN THEORY) and the "ANTHROPIC PRINCIPLE." In any case, the theistic belief that God is a "person" represents an anthropomorphic leap of faith that cannot be justified (see ANTHROPOMORPHISM AND RELIGION). All such explanations as these are suspect because they transcend nature and hence pose immense, probably insurmountable problems of verification; perhaps the best posture about such questions is that of the agnostic. At the very least we should suspend judgment about the surmised transcendental origins of the universe until such time as such theories can be responsibly and evidentially confirmed or disconfirmed.

Appeals to alleged revelations from God or his emissaries as the basis of religious truths are uncorroborated by competent observers and also highly questionable. The historic claims of revelation on the part of the Abrahamic religions encoded in the Hebrew Bible, the Christian New Testament, and the Muslim Qur'an are not attested to by sufficiently reliable eyewitnesses. Biblical and Qur'anic criticism (see BIBLICAL CRITICISM; ISLAM AND UNBELIEF) have shown that these books are not inscribed by God, but are written by fallible human beings; they are the products of apologists for competing faiths. Moreover, if their claimed revelations are taken at face value, they contradict each other. The historical existence of the prophets of the Old Testament such as Moses, Abraham, Isaac, Joseph, and others is dubious. None of the supposed authors of the New Testament—Mark, Mathew, Luke, John, or even Paul—knew Jesus directly. Nor, with the exception of Paul, were their books even written by the men whose names have become attached to them through tradition. These scriptural accounts are second- and thirdhand testimony based on an oral tradition that was often contradictory, and in any case merits suspicion because it was conveyed to posterity by propagandists for a new faith. Similarly, the historical accuracy of the Qur'an and hadith concerning the life of Muhammad is highly suspect, for contrary to Muslim claims that the Qur'an was dictated to Muhammad in a single miraculous event, there is ample historical and textual evidence that there were many different versions of the Qur'an, implying that the Muslim scripture underwent a process of historical development not unlike that of the New Testament.

Basically, secular humanists are *nontheists*; that is, they find insufficient evidence for belief in God, particularly in the monotheistic sense of God as a person. Some secular humanists have declared that they are outright atheists and have no wish to deny that fact. The difference between nontheists and atheists is that atheists usually define themselves primarily by what they are against, whereas nontheists consider their unbelief to be only part of a broader scientific-philosophical-ethical outlook.

Contemporary secular humanists are also not deists in the eighteenth-century sense, for they do not believe that a divine being created or designed the universe and then left it alone. Still, some secular humanists are not unsympathetic to a Spinozistic conception of the universe in which the regularities or laws of nature inspire an appreciation for its vast magnificence; this may even elicit a thoroughly naturalistic form of "natural piety."

Secular humanists reject any belief in the efficacy of PRAYER, in the existence of human immortality (see IMMORTALITY, UNBELIEF IN), or in any hope of receiving salvation from a personal deity. On their view there is insufficient evidence for the claim that the "soul" is separable from the body, that there is a mind-body duality or any "ghost in the machine." All attempts to document an immaterial component to human consciousness, such as the soul, by means of psychical or parapsychological research have thus far been inconclusive (see SPIRITUALISM AND UNBELIEF). According to neurological science, "consciousness" is most likely a function of the brain and nervous system (see COGNITIVE SCIENCE AND UNBELIEF).

Humanist Ethics. Secular humanism expresses an affirmative set of ethical principles and values. Indeed, some humanists even consider humanist ethics to be its most important characteristic of their worldview, which should be emphasized in response to religionists who egregiously maintain that "you cannot be good without belief in God" (see ETHICS AND UNBELIEF). Humanists hold that ethical values are relative to human experience and need not be derived from theological or metaphysical foundations. Implicit in this is the idea that ethics (like science) is an autonomous field of inquiry. Humanist ethics does not begin or end with metaethics—the epistemological analysis of the language of ethical discourse—important as that inquiry is. It focuses instead on concrete conduct in order to make actual normative judgments and recommendations.

The good life is attainable by human beings; the task of reason is to discover the conditions that enable us to realize happiness. There is some controversy among humanists as to whether happiness involves hedonic pleasure primarily or need-satisfaction, creative growth, and a more elevated contentment such as self-actualization. Hedonism historically drew from Epicureanism, self-actualization theories from Aristotle. Modern hedonism is influenced by utilitarianism, while modern theories of self-realization draw upon humanistic psychology as described by Abraham H. Maslow, Carl Rogers, and Erich FROMM. Humanistic psychologists tend to view human beings as potentially good. They argue that each human's development of moral tendencies depends in part on the nurturing care received by the individual and the satisfaction of biogenic and sociogenic needs (including homeostatic and growth needs, self-respect, love, the experience of belonging to some community, creativity, and the capacity for peak experiences). Many humanists have argued that happiness involves a combination of hedonism *and* creative moral development; that an *exuberant* life fuses excellence and enjoyment, meaning and enrichment, emotion and cognition.

Lawrence Kohlberg and Jean Piaget maintained that there are stages of moral growth and development in children and adolescents. Humanists wish to promote such growth in matters of ethics, seeking to elevate the level of taste and appreciation in society. They believe that secular moral education is essential in order to develop the capacity for moral, intellectual, and aesthetic experiences. Moral tendencies have developed in the human species over a long period of evolutionary time; and they are expressed in the development of character and cognition.

Philosophers from Aristotle through Spinoza, Mill, Dewey, Hook, and John Rawls have argued that ethical choices, at least in part, are amenable to reflective wisdom. Some secular humanists were earlier in the twentieth century sympathetic to emotivism—the view that ethical terms and sentences are subjective and cannot be objectively warranted (see LOGICAL POSITIVISM). This position is now largely discredited because many ethical judgments are considered to be objectively justifiable. For those who recognize the role of cognition in ethics, deliberation is an essential part of decision making. During this process value judgments may be appraised in the light of various criteria including our preexisting values and principles, which may be modified; the causes operative in a problematic situation; the facts of the case before us; means-end considerations; the costs of alternative courses of action; and their consequences.

There is some disagreement between those who maintain that the main test of moral principles should be teleological—that is, judging moral rules by whether they fulfill our long-range ends—or deontological, following Immanuel KANT, who maintained that prima facie, general moral principles have some independent moral status. Most humanists argue that we should take into account both sets of data—values and ethical principles—though the most important test is consequential and involves an examination of competing claims within a given situation (see CONSEQUENTIALISM). Moral absolutism is rejected as dogmatic and repressive. This position has been labeled "situation ethics" by Joseph Fletcher (see BIOETHICS AND UNBELIEF), and has been attacked as "relativistic" by critics who claim that it implies a breakdown of all moral standards. Secular humanists deny this, demonstrating that they believe in moral standards but insisting that these grow out of reflective inquiry. Thus secular humanists would consider themselves to be *objective* rather than subjective relativists. They also defend naturalistic ethics, the view that moral problems can best be solved by reference to factual knowledge and human experience.

Clearly, naturalists in ethics reject supernatural morality. They maintain that although the classical religious literature may express moral insights, it is often inadequate to the contemporary situation, for it is based upon an earlier (prescientific, nomadic, and agricultural) level of cultural and moral development. A few examples will suffice to demonstrate this inadequacy. (1) Given belief in the fatherhood of God, any number of moral injunctions may follow concerning the role of

women, monogamy, divorce, abortion, war or peace, and the like. It is thus clear that such belief creates no particular moral obligations. (2) Moral obligations do not depend upon divine sanctions or rewards. To do something because of God's commandments, fear of punishment, or hope for reward in the afterlife, is hardly moral; rather, it may impede the development of a mature inner sense of empathy. (3) A whole series of modern critics—Friedrich NIETZSCHE, Marx, Sigmund Freud, and others—have shown that religion may seek to censor truth, repress sexuality, oppose progress, exacerbate human impotence, and offer solace instead of striving to ameliorate the human condition. "No deity will save us, we must save ourselves," declares *Humanist Manifesto II* (1973). We are responsible for our own destiny; we cannot look outside ourselves and our society for succor or salvation.

Three key humanist virtues are courage, cognition, and caring—not dependence, ignorance, or insensitivity to the needs of others. Humanistic ethics therefore focuses on human freedom. It encourages individual growth and development. It focuses on the need of humanists to control their own destinies; to take individual and collective responsibility for their own plans and projects; to enter into the world not simply in order to understand or adore it, but with the intent to use it with prudence to satisfy our needs and desires. Humanistic ethics emphasizes independence, audacity, and resourcefulness. Prometheus can be recognized as the mythical "saint" of humanism, because he is said to have challenged the gods on high, stealing fire and endowing humans with the arts of civilization.

Life presents us with possibilities and opportunities. The meaning of life grows out of what we discover in our own mortal existence; it emerges in our acts of free choice, our goals and aspirations. Insofar as human beings exist for themselves, they are able to define their own realities; they are always in their individual processes of becoming. The salient virtue here is autonomy. Concomitant with this, however, is the recognition that no person can live in total isolation, for humans are social animals. Among the most enduring of human goods are those that we share with others. Some form of altruistic caring is essential to our very being. Developing an appreciation for the common moral decencies (or virtues) and cultivating a general sense of goodwill toward others helps human beings to restrain purely ego-centered interests.

The conflict between self-interest and the social good represents the classical moral paradox. For secular humanists, there may be no easy solutions for some of the dilemmas and tragedies that we encounter in life. Only a reflective decision can best balance competing values and principles, or balance self-interest with the needs and demands of others. Although there are some prima facie general guidelines, what we do depends in the last analysis upon the context in which we decide.

Humanist ethics expresses a concern for equality and social justice. Humanists agree with the religious tradition insofar as it supports the idea of the siblinghood of humankind—though not because God commands it, but rather because moral reflection recognizes that we have responsibilities to other human beings. Each individual is to count as equal in dignity and value, an end in himself or herself, entitled to moral consideration; that is the basis of our conception of democracy and human rights, particularly on the global level. We also have some obligation to other forms of sentient life and to other species on the planet Earth.

Sociopolitical Perspective: Democratic Humanism. Secular humanism has had a variety of sociopolitical outlooks during various historical periods. It is concerned throughout with justice and the common good. In the modern world it has emphasized the civic virtues of democracy. There are many sources of the democratic philosophy. John Locke defended human rights, tolerance, and the right of revolution, and John Stuart Mill the right of dissent. In the twentieth century, Sir Karl Popper indicted totalitarian regimes from Plato to Marx and defended pluralistic open democratic societies. John Dewey characterized liberal democracy as a "method of inquiry" engaged in by the public in order to develop sensible policies and elect the officials to carry them out. Dewey wished to rely on education to cultivate an intelligent citizenry able to make informed judgments. Sidney Hook sought to justify democracy on empirical grounds, in the light of its consequences: democratic societies provide more freedom and equality of concern, less duplicity and cruelty, more opportunities for cultural enrichment, creativity, and shared experiences, and higher standards of living. Secular humanists maintain that *political democracy* is essential for a democratic society. The laws and policies of a just government are derived from the "freely given consent" of a majority of the adults voting in elections, with the legal right of opposition, minority rights, due process of law, and civil liberties guaranteed. This is dependent also upon voluntary civic associations and a free press. It presupposes that there is some measure of social equality and free access without racial, ethnic, class, religious, or gender discrimination. It also believes in some measure of economic democracy, in the sense at least that the working population can share in the goods produced by the economy, and that it can through government exercise some democratic control by such means as regulation and taxation.

There has been considerable controversy in the twentieth century between the advocates of economic libertarianism and the proponents of social democracy. Disciples of laissez-faire such as Ayn RAND wish to limit governmental intrusion in the economy, and maintain that free-market economies are better able than planned economies to achieve growth. Social democrats and liberals believe that the government has an obligation to step in when the private sector is unable to satisfy public

needs or the general welfare, and when it violates what they consider to be social justice and the "principles of fairness." Secular humanists recognize that although they may rightly disagree among themselves about any number of specific economic policies, what they share in common is a commitment to the democratic process and the application of reason and science to the solution of social and political problems.

A central controversy that engaged secular humanists throughout the twentieth century was the dispute between liberal democratic humanists and Marxist-Leninists. Western liberal humanists such as Sir Isaiah Berlin and Sidney Hook emphasized the vital importance of civil liberties and political democracy, asserting that totalitarian Marxist regimes had betrayed the principles of humanism. Some Eastern European Marxist humanists pointed to Marx's youthful *Economic and Philosophical Manuscripts* (1844) with its emphasis on freedom. The vigorous opposition to Stalinism by such thinkers and activists as Svetozar Stojanović, Ljubomir Tadić, and others helped to blunt the force of totalitarian communism in Eastern Europe.

During the historic battles within democratic societies for equal rights, humanists and secularists, often in alliance with liberal religionists, have generally supported an agenda of liberation. In the nineteenth century they opposed slavery (see DOUGLASS, FREDERICK; INGERSOLL, ROBERT GREEN; WRIGHT, ELIZUR) and campaigned for woman suffrage (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). In the twentieth century they supported the battle for feminism and advocated the rights of minorities, blacks (see FARMER, JAMES), gays and lesbians, the disadvantaged, and the handicapped.

The continuing battle for democracy has been accompanied by a call for the separation of church and state. The Religious Right in the United States has insisted on making the voice of religion inappropriately prominent in the public square, and it has attempted to secure governmental funding for religious schools and charities (see CHURCH, STATE, AND RELIGIOUS FREEDOM). It has sought to mandate the teaching of creationism or intelligent design alongside of evolution in the public schools and has tried to limit the rights of unbelievers. All such measures were opposed by secular humanists. They believe that religion should be a private matter, that the integrity of science should be defended so that students can be exposed to the best of science, and that the rights of nonbelievers should be given equal status with believers.

Secular humanists have been especially strong proponents of the *right to privacy*. In questions of medical ethics, this entails support for the right to confidentiality, and to informed consent on the part of patients (see BIOETHICS AND UNBELIEF). Secular humanism has also stood in favor of reproductive freedom, including access to contraception, abortion, and in vitro fertilization (see BIRTH CONTROL AND UNBELIEF; SEXUAL VALUES, IMPACT OF UNBELIEF ON). It has also defended the right to die with dignity through such causes as beneficent euthanasia, assisted suicide, and living wills. The right to privacy has been extended to sexual freedom: freedom from undue censorship (entailing the right of adults to publish or read pornographic literature), and of consenting adults to pursue their own sexual proclivities (including for example adultery, consensual sodomy, and same-sex relationships) without repression by the state.

The right of privacy, however, is not defended in isolation from other rights, nor is the relationship of the individual to the social fabric ignored. Although secular humanists emphasize tolerance of competing lifestyles in a pluralistic society, they are not defenders of unbridled libertinism. They advocate the development of excellence and creativity, moderation and self-restraint, and prudence and rationality in an individual's personal life, and some sensitivity for the needs of others. They do not wish to legislate private morality, but rather seek by persuasion to develop moral character and ethical rationality.

The secular humanist movement has not confined itself simply to abstract theoretical ideas, but has sought to put its ideas and values into practice. It has endeavored to develop grassroots support by building centers and communities worldwide for nonreligious people who are committed to reason, science, free inquiry, secularism, humanist ethics, and democracy. It has focused on education as the best means of developing an appreciation for critical thinking, the naturalistic cosmic outlook, and humanist values.

Planetary Humanism and the New Paradigm. Secular humanists recognize that it is no longer possible for any one nation to solve its problems in isolation from the rest of the world. Interdependence is clearly evident in the areas of trade and commerce, communications and travel, education, culture, and science. Unfortunately, severe political, economic, and military competition has often led to war. Religious hatred has likewise engendered violence.

The underlying and unresolved issue the world faces is the use of force by independent nation-states to settle disputes among themselves. The failure of the League of Nations led to the founding of the United Nations in 1945 at the end of World War II. The problem confronting an exhausted world was how to develop principles of collective security, enabling nations to resolve disputes peacefully without the resort to war. Secular humanists have played an important role in attempting to work out methods of negotiation and compromise on the global scale.

Many humanists were involved during the early days of the United Nations, including Sir Julian HUXLEY (first head of UNESCO), Lord John Boyd-Orr (head of the World Food Organization), and Brock CHISHOLM (first director general of the World Health Organization). Both the INTERNATIONAL HUMANIST AND ETHICAL UNION and the Center for Inquiry/Transnational have special con-

sultative advisory status within the UN as nongovernmental organizations. *Humanist Manifesto II*, published in 1973 at the height of the Cold War, deplored the division of humankind on nationalistic grounds.

Humanist Manifesto 2000 (HM2000), endorsed by the International Academy of Humanism, provides a "new global agenda" to implement humanist values. It states that the overriding need is "to develop a new Planetary Humanism" that will seek to preserve human rights and enhance human freedom and dignity and will emphasize our commitment "to humanity as a whole." The underlying ethical principle "is the need to respect the dignity and worth of all persons in the world community." Thinkers as diverse as Peter Singer and Hans Küng also emphasize the need for a new global ethic beyond nationalistic, racial, religious, and ethnic chauvinism. HM2000 sets forth a new "Planetary Bill of Rights and Responsibilities." This includes the recognition that the planetary community has an obligation to do what it can to preserve the global environment and end world hunger, disease, and poverty. National programs of health, welfare, education, ecology, and prosperity now have to be transformed to the transnational level. HM2000 recommends a set of measures that would strengthen existing UN institutions. But it goes further by calling for an effective new World Parliament elected by the people of the world, not by nation-states; a worldwide security system to resolve military conflicts; an effective world court with enforcement powers; and a transnational environmental protection agency able to preserve the natural ecology and protect other species from extinction. It also recommends an international system of taxation to assist the underdeveloped regions of the world; universal education and healthcare for every person on the planet; some procedures for regulating multinational corporations; a free market of ideas through universal access to the media of communications, which would be under the control neither of nation-states nor global corporations; and some respect for multicultural differences, notwithstanding the need to find common ground for the new planetary civilization that is emerging.

HM2000 concludes with a note of optimism about the human prospect. It rejects theologies or ideologies of despair that look outside of nature for salvation. It affirms that life on planet earth can be continually improved and enhanced, provided that human beings are willing to assume responsibility for their own destinies and are willing to undertake cooperative efforts with other men and women of goodwill to achieve a better future for all.

Conclusion. Secular humanism emphasizes the use of reason and critical intelligence to solve human problems. It has confidence in the ability of the human species to apply science and technology for the betterment of human life; it is skeptical of the existence of occult, paranormal, or transcendent realities. Although it is the modern-day version of classical atheism in what it rejects, it also expresses a positive normative concern for developing constructive ethical values relevant to the present conditions of humankind on this planet. It is uncompromising in its commitment to democracy and planetary humanism, and it considers human freedom and fulfillment to be the highest human values. In all of these ways it offers a new paradigm for guiding human life in what might be termed the post-postmodern era.

PAUL KURTZ

SECULARISM. *Secularism* is one of three nouns (the others being *secularity* and *secularization*) derived from the adjective *secular*, but is used in most general encyclopedias to encompass all three. Thus *Britannica* defines it simply as "a movement in society directed away from otherworldliness to life on earth." This dichotomy has always been more pronounced in Christendom than among other religious communities, which have tended to associate sacred and secular concerns more intimately. *Secular* comes from the Latin, as in *ludi saeculares* (Secular Games), held by Etruscans and ancient Romans every *saeculum* (generation or century)—ironically, as a dedication to the gods.

Early in the Common Era, Christians were often persecuted and so tended to go underground, literally and metaphorically, in Rome, or into the desert as hermits or members of small communities, where they looked to the Second Coming of Jesus for deliverance. After Christianity became the established religion of the Roman Empire, these communities persisted in monasteries, convents, and, later, friaries. Because each followed a "rule" devised by the order's founder that regulated members' entire existence, they became known as "regular clergy." Some remained completely cloistered, while others ventured outside to preach, teach, or minister. Though a few secular orders were recognized, the term "secular clergy" referred principally to parish priests who belonged to no order and were responsible solely to their diocesan bishop.

During the Renaissance and the Reformation, the systematic study of ancient languages in order to standardize variant manuscript versions of scripture and facilitate translation into the vernacular unearthed a number of nonreligious texts. These revealed advanced philosophical and protoscientific ideas that unsettled scholars among the faithful and caused some to become religious humanists (see RELIGIOUS HUMANISM), others to become atheists. During the religious wars of the seventeenth century, open profession of ATHEISM became too dangerous. Unbelievers who could not accept the creator-sustainer god of theism opted instead for the First Cause god of DEISM or a noncommittal FREETHOUGHT. By the nineteenth century it was safe to return to ATHEISM or to embrace the new Unitarianism, Universalism (see UNITARIANISM TO 1961; UNIVERSALISM TO 1961; POSITIVISM, AGNOSTICISM, ETHICAL CULTURE, or RATIONALISM). In the twentieth century a more ambiguous HUMANISM emerged.

Secularity. The nineteenth century also saw the rise in the first world of democracy and civil liberties, together with the concept of secularity, or the separation of church and state. It was the beginning of what is now called multiculturalism. This was a demand for the removal of, first, civil disabilities experienced by religious minorities and unbelievers; and second, special privileges enjoyed by the religious majority. The latter demand took many forms: where there was an established church, its disestablishment and disendowment; removal of state funding for all religions, majority or minority, and an end to the special status of chaplains in state institutions like prisons, hospitals, and the armed forces, and to the automatic right of religious leaders to sit in legislatures; abolition of BLASPHEMY laws that protected one or some religions from public criticism, and of penalties and taxes that disadvantaged heterodox publications; and the introduction of free, compulsory, and secular education. This meant the absence of prayers, acts of worship, and tendentious religious instruction in state schools, and the end of public funding for religious schools. Usually there was no complaint against objective teaching about religion in history, social studies, and similar lessons. Especially in the United States, lobbies today have partly succeeded in undermining secularity by getting "creation science" or creationism onto some syllabi as an alternative to evolution (see CREATIONISM AND UNBELIEF; INTELLIGENT DESIGN THEORY). But occasionally the implementation of secular education has

been taken to extremes. Examples are the bowdlerization of popular poems in the state schools of Victoria, Australia, early in the twentieth century to exclude the Persons of the Trinity, and the recent banning in French state schools of "religious attire" like large crucifixes, Jewish skullcaps, and Muslim head scarves.

The secular principle defends the basic rights of freedom of conscience, worship, speech, publication, and assembly, and equality of opportunity. A country's government is for all its people, regardless of the ideology of individuals. Each person has a right to all the benefits of the state, and the state has a duty of even-handedness. Religious privileges encourage hypocrisy and timeserving among those who affect a belief to gain a benefit, while undermining the independence, sincerity, and vigor of religious institutions themselves. Thus a minority of religionists, especially among Protestant Christians, supports secularity. Believing that the spiritual and temporal worlds should remain apart, they invoke injunctions attributed to the gospel Jesus—"Render to Caesar the things that are Caesar's, and to God the things that are God's" (Mark 12:17)—and the Apostle Paul—"And be not conformed to this world" (Rom. 12:2). Such Christians may speak of being "in the world but not of it." In the United States they have made common cause with unbelievers in such organizations as Americans United for the Separation of Church and State. There is no similarly powerful body in other countries, but secular societies commonly have some religious, even clerical, members or supporters.

Separation, including secular education, has been achieved in a minority of countries. Among them are the United States (1791), France (1795, 1871, and 1905), Mexico (1859), New Zealand (1877), Victoria and New South Wales, Australia (1872 and 1880), the Commonwealth of Australia (1901), Portugal (1911), the Soviet Union (1918), Turkey (1928), and India (1947). A paradox is that some of these countries, notably the United States, have a high proportion of churchgoers and display much public religiosity. Their secular constitutions are rarely attacked openly but are undermined by outsourcing public services to "faith-based" institutions and trying to sabotage secular education. This takes a dual form: increased public funding of church schools, and the introduction of prayers, bible readings, and creation science to state schools.

Contrary to popular opinion, for much of Islam's classical period (seventh to fourteenth century CE) separation of mosque and state existed, if controversially, in the Islamic world; only later were religion and politics seen as inextricably interwoven. Yet Turkey has demonstrated that secularity is still possible in twenty-first-century Muslim countries when there is tolerance on both sides.

Secularism. *Secularism* is the term by which unbelief was generally known in the English-speaking world for most of the second half of the nineteenth century. It persists today in the name of a few societies and in the description SECULAR HUMANISM.

On March 21, 1849, a prominent but disillusioned English Owenite and Chartist, George Jacob HOLYOAKE, recorded in his diary: "Issued the first 'Secular' number of the *Reasoner*," his freethinking weekly journal. In its December 3, 1851, issue he wrote: "Giving an account of ourselves in the whole extent of opinion, we should use the word 'Secularist' as best indicating that province of human duty which belongs to this life." He had rejected *ATHEISM*, *nethism*, and *limitationism* as too narrow, and *cosmism*, *realism*, and *NATURALISM* as too ambiguous. Though he attributed inspiration for his chosen label to George Henry Lewes, the life partner of George ELIOT, the freethinking solicitor and publisher W. H. Ashurst has been named instead by the historian Edward Royle. In subsequent lectures, newspaper articles, encyclopedia entries, and books, Holyoake elaborated the themes of "service of others a duty of life" and "the secular is sacred," so that the historian Rev. W. N. Molesworth called secularism "a system of ethics." Robert Green INGERSOLL, the prominent agnostic orator and president of the AMERICAN SECULAR UNION, called secularism "a religion of humanity."

In 1851, however, under Holyoake's auspices a Central Secular Society was formed in London with a broader and nonreligious statement of principles: (1) science is the true guide of man; (2) morality is secular, not religious, in origin; (3) reason is the only authority; (4) freedom of thought and speech are basic rights; (5) owing to the "uncertainty of survival" man should direct his efforts to this life only.

Up and down England, but chiefly in the industrial counties of Lancashire and Yorkshire where Owenism began (see OWEN, ROBERT), existing Owenite groups adopted the new name and new secular societies were formed. As the above principles show, their function was principally educational and propagandist. Many of their members, and indeed their leaders, had left school before their teens at a time when even the privileged and well-educated were faced with an explosion of new knowledge in the sciences, technology, and biblical criticism. Often they had been brought up in church or chapel and on leaving it became aware of its aesthetic, social, and emotional role, which they tried to reproduce with secular "hymns," rite-of-passage ceremonies, and wholesome entertainment.

Though he had once edited an atheist journal, the *Oracle of Reason*, and been imprisoned for blasphemy, Holyoake came to believe, like PROTAGORAS, that the gods—if they existed—could take care of themselves and "the Secularist deals only with what is provable by experience." When Thomas Henry HUXLEY coined the word *agnostic* in 1869, Holyoake adopted that label (see AGNOSTICISM). This was one of the views that, together with a series of personal disputes, brought him into conflict with a rising star in the secularist firmament.

Charles BRADLAUGH, mindful of how his local vicar's intervention had caused him to lose home and employment as a teenager, was militantly anticlerical, though he was to form friendly relations with more liberal clergymen. While he always said "I do not deny God, because that word conveys to me no idea," his view was: "Mr. Holyoake says truly that Secularism should be 'independent of theology,' but as theology demands universal empire, independence can only be achieved by Secularistic resistance to Theistic teachings—that is, by the promulgation of Atheistic views."

Though he had earlier been associated with revolutionary organizations and public demonstrations, Holyoake had come to dissociate himself from both. Above all, he declared that "freethought literature should be kept free from the suspicion of immorality." This taboo included contraceptive tracts, especially when—as in George Drysdale's *Elements of Social Science* (1854) and Charles KNOWLTON's *Fruits of Philosophy* (1832)—there was a hint that they could be used for more than family planning. Holyoake had in fact republished the latter volume himself but, when Bradlaugh and Annie BESANT were prosecuted in 1877 for the same "offense," Holyoake claimed never to have read it.

In 1860 Bradlaugh became a founding coeditor, and subsequently sole editor and proprietor, of the *NATIONAL REFORMER*. He described it as atheist, republican, and (neo-)Malthusian, though he did at one point assert that "Secularism is, in fact, humanitarianism." When all but four of Britain's secular societies united in 1866 to form the NATIONAL SECULAR SOCIETY, of which Bradlaugh became president, only this humanitarian goal was explicit. In addition to the aspirations of secularity outlined above, the society's principles did however declare that "the religious teachings of the world have been, and are, obstacles to the proper attainment of human happiness." From that point the influence of Holyoake and his views declined and that of Bradlaugh rose. The *Fruits* trial led to a split in the National Secular Society and formation of a British Secular Union in 1877, but the union attracted only those who were malcontents for a variety of reasons and folded in 1884.

With many motivations, notable secularists emigrated from Britain for a period or for life, most of them taking Bradlaugh's message with them. Some had been vice presidents and accredited lecturers of the National Secular Society and were sent out with his blessing at the request of freethinkers in the British colonies. Charles SOUTHWELL, Joseph SYMES, William Whitehouse COLLINS, Robert STOUT, John BALLANCE, William Willis, and others went to Australia and/or New Zealand, and Charles WATTS to Canada (see also WATTS, KATE EUNICE). In her role as a Theosophist, Besant took some of Bradlaugh's spirit to India (see THEOSOPHY). Organizations were formed, and have continued to be formed, with "secular" in their names at Auckland (1854); Toronto (1877); Melbourne (1882); Wellington, New Zealand (ca. 1885); New York (ca. 1885); Sydney (1966); Melbourne (1978); Amherst, New York (1980); and Sydney (2005). With the exception of the Council for Secular Humanism, which is still flourishing under Paul Kurtz, and the recent Sydney body, these bodies were transient; but their essentials continued under rationalist or humanist banners. And in Britain the National Secular Society is also flourishing, if with hiccups along the way.

The positive ethical, libertarian, and humanitarian message of secularism is enduring, but its "negative," or critical, objectives have changed with circumstances over the years. In Bradlaugh's lifetime the "religious teachings of the world" that attracted its chief criticism in Britain, and to some extent in the colonies, were those of the Church of England because of its political, educational, economic, and social power. While these criticisms have persisted into the twentieth and twenty-first centuries, increasingly the main sectarian target has been the Roman Catholic Church. This has brought the concerns of the Anglo-American world into harmony with those of the world outside. Not only the Vatican's involvement in the rise of Fascism, Nazism, and other repressive regimes around the world, but—strengthened by Protestant fundamentalism—its impact in every country on attitudes to abortion, artificial contraception, homosexual activity, embryonic stem cell research, and other issues of bioethics (see BIOETHICS AND UNBELIEF) is seen as a major impediment to civil liberties, health, and population control.

Secularist censure has also extended to fundamentalist Islam and beyond "religion," narrowly understood, to "supernaturalism" when it became clear that many who left mainstream churches were turning to bizarre cults, spiritualism, parapsychology, tarot cards, astrology, and other forms of fortune-telling. Political ideologies like Stalinism and Maoism that operated as quasi-religions were also repudiated.

Secularization. The documented departure of growing numbers from the churches in most Christian countries, and apparently from synagogues and temples if not from mosques, represents a global trend, though one which experiences reversals along the way at times of family, national, or international crisis. Without thinking about, let alone formulating specific views on, the truth or falsity of religion, people have been drifting away; at first fearfully lest the heavens open, then confidently as nothing untoward happens. Partly this arises from an explosion of alternative activities, sporting, recreational, and artistic, in which they can engage. Partly it has to do with the explosion of scientific and technical knowledge which has given humans greater control over human destiny. This development has advanced slowly since the Renaissance and the Industrial Revolution, but accelerated in the past fifty years (see DEMOGRAPHY OF UNBELIEF).

For knowledge of the natural world people turn to scientific literature, not Genesis 1. Instead of divine providence they rely on lightning rods, smoke detectors, and

insurance policies. For personal advice they turn to doctors, therapists, social workers, accountants, and lawyers rather than priests. In brief, they conduct their lives on the pragmatic principle that "the Lord helps those who help themselves." Sociologists and theologians call it "secularization."

SECULARIZATION HYPOTHESIS. See **DEMOGRAPHY OF UNBELIEF.**

SEMPLE, ETTA MARTHA DONALDSON KILMER (1855–1914), American freethinker and women's activist. Founder and president of the Kansas Freethought Association and vice president of the AMERICAN SECULAR UNION, Etta Semple edited and published a widely circulated FREETHOUGHT newspaper, first titled the *Freethought Vindicator*, then the *Freethought Ideal*, from 1895 to 1901. Through her paper she attacked racial bigotry, opposed capital punishment, strongly supported separation of church and state, and was a fearless champion of the working class. She wrote two novels on labor themes, *The Strike* and *Society*, and ran twice for public office on a Socialist Labor ticket, losing each time, but still ahead of others in the party (see LABOR MOVEMENT AND UNBELIEF).

In her "Demands of Liberalism" (1898) she demanded an end to church tax exemptions, the public employment of chaplains, public appropriations to sectarian charities, Bible reading in public schools, religious oaths, Sabbath blue laws, and national religious festivals.

Blazoned across each issue of the *Ideal* was this offer: "A Reward of $1,000 will be given to the Man, Woman or Child who will Furnish Positive Proof of A God, the Holy Ghost, Jesus Christ (as a savior), the Soul, the Devil, Heaven or Hell, or the Truth of the Bible."

A resident of Ottawa, Kansas, for twenty-seven years, she ran an osteopathic sanitarium in her own home, a rambling thirty-one-room house that, although now derelict, still exists. For many years it was the only hospital in Ottawa, and under her humanitarian charge no patient was ever turned away for inability to pay. She put her life and what little worldly goods she had to the service of her community. Despite her freethought views, which alienated many and even resulted in an assassination attempt, upon her death from pneumonia at age fifty-nine the whole town closed down in order that everyone could attend her funeral.

Her grave lay unmarked for eighty-seven years until the Franklin County Historical Society and local freethinkers raised sufficient funds to erect a headstone, which was dedicated May 1, 2002. The stone bears her own epitaph, which she wrote a few years before she died: "Here lies a woman that through her peculiar disposition lived a life of turmoil as did all who knew her."

SEVERANCE, JULIET H. STILLMAN (1833–1919), American sex radical and physician. As a youth in the "Burned-over District" of upstate New York, Juliet H. Severance embraced antislavery, dress reform, temperance, water cure, and women's rights. She began to have doubts about her religious convictions in the late 1850s after encountering a Spiritualist medium and reading Thomas PAINE's *Age of Reason*. Becoming a staunch advocate of individual freedom, she devoted the remainder of her life to radical reform and gained recognition for her ideas among anarchists (see ANARCHISM AND UNBELIEF), freethinkers, and third-party politicians.

Early Years. Born in DeRuyter, New York, on July 1, 1833, to Walter F. and Catharine Stillman Worth, Severance was raised a Quaker but converted to the Seventh-Day Baptist faith while attending the DeRuyter Seminary. Socially conscious from an early age, she had by 1847 begun giving lectures on women's rights, dress reform, antislavery, and temperance. In 1852 she married John Dwight Stillman and moved with him to DeWitt, Iowa. The mother of two sons, she nonetheless traveled to New York City in 1857 to matriculate in Russell Trall's Hygeio-Therapeutic College, from which she graduated with an MD degree in May 1858. While there, exposure to Spiritualism and liberal literature led Severance to deliver her first speech against marriage (see SEX RADICALISM AND UNBELIEF).

Reform Career. Writing and speaking about evolution (see EVOLUTION AND UNBELIEF), marriage, and health reform, Severance practiced medicine in Iowa before moving to Whitewater, Wisconsin. Undeterred by the stigma of her 1862 divorce and her friendship with free-

love advocate Victoria C. WOODHULL, she married freethinker Anson B. Severance in 1869. In addition to serving in state associations of Spiritualists in Illinois, Wisconsin, and Minnesota, she played a prominent role in the NATIONAL LIBERAL LEAGUE. Elected vice president in 1880, she represented a faction of freethinkers who wanted the League to demand repeal of the Comstock Law (1873; see COMSTOCK, ANTHONY, AND UNBELIEF). Angered by Severance's efforts to dominate the league's agenda, Robert Green INGERSOLL resigned and with other disaffected league members established the AMERICAN SECULAR UNION.

Final years. Disillusioned by the political ineffectiveness of American liberals, Severance turned to the Knights of Labor and the Union Labor Party. Following Milwaukee's Bay View Massacre in 1886, she increasingly aligned herself with anarchists, and in 1898 she moved to Chicago, where she practiced medicine, lectured at freethought and anarchist meetings, and supported the work of sex radical publisher Moses HARMAN. She retired from practice in 1908 and moved to New York City to live with her daughter. To the end, she had no fear of public opinion, and freely criticized church and state for their oppression of individual freedom.

SEX RADICALISM AND UNBELIEF. The free-love movement of the mid-nineteenth century was made up of atheists and agnostics as well as Spiritualists (see SPIRITUALISM AND UNBELIEF), sentimentalists who believed in spiritual connections between people rather than utilitarian marriages aimed at procreation. By the 1870s, however, a split occurred, with the more conservative (Spiritualist) faction of the free-love movement attempting to disassociate itself from the freethinkers, who emerged at the forefront of controversy and influence.

Sex radicals, as those involved in the nineteenth-century free-love movement are called, were not simply a promiscuous lot. Many of them, both males and females, were feminists who believed that woman's emancipation could never be achieved until she possessed complete dominion over her body. They advocated that one should be able to choose his or her sexual partners without interference or sanction by the church or state. In fact, Moses HARMAN maintained that, in the interest of improving the human race (see EUGENICS), every woman should have the right to freely choose her sex partners, because any child born of such a union would be superior to one born of a coerced and loveless marriage where the woman was legally viewed as property. This ideal was in direct contradiction with many religious teachings, especially those of Christianity. Therefore, many sex radicals were rationalists, agnostics, or freethinkers, and a large number were former Christians.

Female free-love advocates like Dora Forster scorned the "double standard of morality" that Puritans imposed on unmarried women who were forced to live celibate lives while men (married or single) could hire prostitutes, who were also then degraded by society. Feminists especially envisioned the possibilities of a better society where both women and men were free to express themselves sexually (see SEXUAL VALUES, IMPACT OF UNBELIEF ON).

In addition to unorthodox ideas about sexuality and equality between men and women, other liberal ideas tended to prevail among the sex radicals. Most were social reformers. Abolitionism was a high priority for many; their belief in equality did not stop at gender, but expanded to race as well. They likened the status of women in society, especially married women, to that of slaves. Many free-lovers were anarchists (see ANARCHISM AND UNBELIEF) whose belief in the sovereignty of individuals necessarily extended to the abolition of the church and state, which exerted an unacceptable spiritual and economic hold on humanity.

One of these freethinkers was abolitionist and individualist anarchist Stephen Pearl Andrews, an attorney, author of *Science of Society*, philosopher, and a tireless proponent of Josiah Warren's equitable commerce theory. In 1851 Andrews and Warren founded Modern Times, a utopian community east of New York City where they could put their theories into practice. "Cost the limit of price" was the standard for commerce at Modern Times, and a Time Store was opened where members of the community could purchase goods on this basis. Labor notes were traded instead of money, and the cost of women's labor equaled that of men's. Modern Times briefly thrived under this style of economic self-government.

Andrews's belief in the sovereignty of the individual extended to personal relationships between men and women, and although he had legally married twice, philosophically he rejected traditional marriage, believing it constituted slavery for women. Hence, marriage arrangements at Modern Times were left up to the individuals involved. Word of this free-love commune spread, and along with it misunderstanding. Soon there was a barrage of various undesirables who all but ran the town into the ground, and Modern Times died a notorious death. Undaunted, Andrews packed up and moved his ideals and his family to New York and in the late 1850s founded the Unitary Home.

Andrews met Victoria WOODHULL in New York in 1870, just as she and her sister Tennessee Claflin were

about to begin publishing *Woodhull & Claflin's Weekly*. His view that it is a woman's right to freely choose her sex partners so impressed the two sisters that they immediately gave him the post of editor. In 1872 Andrews endorsed Woodhull's candidacy for president on the newly formed Equal Rights Party platform. On Election Day in 1872, Woodhull was sitting in jail on charges of violating the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF) for her article exposing the extramarital affair of Elizabeth Tilton and the Reverend Henry Ward Beecher. The *Weekly* lasted until 1876. Andrews later became involved in the Manhattan Liberal Club, made up mostly of freethinkers, where he lectured regularly, and the more militant Uniform Reform League. He died in 1886.

The printed evidence of these sex and marriage reform movements was manifested in other papers as well, such as the *Word*, published by Ezra and Angela HEYWOOD of Princeton, Massachusetts; and *Lucifer, The Light Bearer*, published by Moses Harman of Valley Falls, Kansas. Ezra Heywood, an abolitionist and former student of the ministry, was influenced by the individualist anarchist Josiah Warren. Heywood became an anarchist and pacifist and openly criticized the Civil War, although most of his abolitionist comrades supported it. Begun in 1872 as a journal devoted to women's equality and labor and monetary reform, the *Word* followed some earlier tracts written by the Heywoods that promoted sexual liberation. After the formation of the New England Free Love League in 1873, the *Word* became a free-love newspaper. Ezra Heywood's pamphlet *Cupid's Yokes*, published in 1876, was a critique of marriage and promoted birth control. It was widely distributed, and it was Heywood's intent to "promote discretion and purity of love by bringing sexuality within the domain of reason and moral obligation."

Lucifer, The Light Bearer was by no means the first publication of the free-love movement, however, it was the most influential and longest running journal of them all. Initially published under the title the *Kansas Liberal*, it took on the most burning and controversial sexual issues of the day, and publisher Harman's no-censorship policy allowed these issues to be fully debated in print. He promoted "free marriage" between consenting adults and without religious or governmental interference. Harman's daughter Lillian HARMAN and her partner, Edwin C. Walker, were jailed for such a relationship.

Other free-love periodicals, such as *Hulls' Crucible*, published in Boston by Moses Hull; *Foundation Principles*, published in Kansas and California by Lois WAISBROOKER; and *Fair Play*, published in Kansas and Iowa by Edwin C. Walker and Lillian Harman, were also available to women who did not otherwise have access to information on sexual matters. Their common mission was in direct conflict with the puritan morals of Victorian society, but it was the Comstock Postal Act of 1873, which criminalized mailing or receiving "obscene, lewd or lascivious material," that cost many people stiff fines and harsh jail sentences. Although the act failed to define those vague terms, any discussion of sex, abortion, or birth control was criminalized, even if it was reprinted from another text such as the Holy Bible or a government publication. The law also targeted freethinkers by outlawing criticism of Christianity. The First Amendment notwithstanding, all that was needed was for the local postmaster to decide a publication or even a postcard was in violation to prevent it from being delivered, and to have the perpetrators arrested and tried.

Anthony Comstock, a young, militant crusader of Puritan values, believed he was called upon by God. He was first hired by the New England Society for the Suppression of Vice, a private organization headed by soap magnate Samuel Colgate, to enforce the existing obscenity laws. Soon after, he was sent to Washington to lobby for a stronger law, and succeeded. The new act provided for prison terms of up to ten years for violation of the act. Comstock was given so much autonomy that he was able to relentlessly harass violators, ruining their lives and livelihoods, driving some to suicide (see CRADDOCK, IDA), about which he later boasted.

It was not only publishers of obscene materials who were targeted by Comstock. Those who sold, advertised, or distributed such materials were also on his hit list. Such was the case of D. M. BENNETT, editor of *THE TRUTH SEEKER*, a prominent freethought newspaper. Bennett had been arrested before on obscenity charges through Comstock's famous modus operandi, decoy letters. Bennett was fined three hundred dollars and given thirteen months in prison for selling copies of Heywood's *Cupid's Yokes*. While the National Defense Association, a group of reformers who joined forces to fight against obscenity laws in general and Comstock in particular, was able to procure President Rutherford B. Hayes's pardon of Heywood, Bennett was not so fortunate; he served his entire sentence. Even with the able agnostic Robert Green INGERSOLL taking Bennett's side, Comstock intervened and put pressure on Hayes to refuse to pardon Bennett. But while Bennett's sentence had a beginning and an end, Heywood would never be free from Comstock. Determined to continue his struggle to preserve his freedom of speech, Heywood was arrested three more times on obscenity charges, once for publishing an edition of Walt WHITMAN's *Leaves of Grass*. Other charges were based on advocating and selling contraceptive devices for women. Most indictments against Heywood were dropped, although finally, at the age of sixty-one, he served a sentence of two years (minus two months) at hard labor. He died a year after his release. Although Angela Heywood had committed the same crimes as her husband, and was at least as vocal and vehement in her ideas of women's sexual emancipation, she was never arrested.

Comstock continued his relentless vice hunting until his death. Although his health had deteriorated substan-

tially due to his constant vigilance in the battle to protect society's morals, he rarely allowed himself a rest from his calling. Comstock died in 1915 of pneumonia, which he contracted shortly after his return from the International Purity Congress, to which he was appointed as a delegate by President Woodrow Wilson. Despite many attempts by his enemies to turn the tables on him and find some scandal that would vindicate them, Comstock seemed to have no vices.

Regardless of the blatant constitutional violations, as well as the efforts of many to repeal it, the obscenity law was not changed until the 1930s, but the free-lovers had made their mark. They were decades ahead of their time, and many of their radical ideals are common practice today.

SEXUAL VALUES, IMPACT OF UNBELIEF ON. Sexual values in Western culture were heavily influenced by Christian culture, particularly the writings of Saint Augustine. Augustine's views combined neo-Platonism (see PLATO), neo-Pythagoreanism (see PYTHAGORAS), Gnosticism, and Manichaean dualism. These views he cobbled together to emphasize that sex was a weakness of the flesh and that continence was the most desirable lifestyle. He was particularly offended by the act of coitus, which he held brought the "manly" mind "down from the heights." Augustine was particularly upset that propagation of the human species could not be accomplished without what he felt were bestial movements and violent lustful desires. Sexual lust was, for him, the inevitable result of the expulsion of Adam and Eve from the Garden of Eden.

Augustine recognized that the Bible had commanded humans to be fruitful and multiply, and that he had to accept this as a Christian, but he was unhappy about it. He compromised enough to allow that sexual intercourse could be justified only within marriage and only for purposes of procreation. Marriage, he held, transformed coitus from a mere satisfaction of lust to a necessary duty, but it was only the employment of the sex act for human generation that ultimately allowed it to shed some of its inherent sinfulness. Augustine ended up condemning all sexual activity between unmarried persons, limiting sex within marriage to the sole purpose of procreation and then only in the male-superior position. Though Christians undoubtedly found these teachings about sex difficult if not impossible to accept in practice, they were reinforced by successive "doctors of the church" including Saint Thomas Aquinas.

Though Protestants in general objected to the imposition of clerical celibacy by law, seeing no special virtue in being celibate and considering celibacy unattainable for most, they continued to regard it as an ideal. But sex was still to be limited to those who were married; Martin Luther felt so strongly about this that he in at least one case condoned bigamy in order to keep sex within marriage. The most positive of the religious reformers in the area of sex was John Calvin. Calvin held that coitus was undefiled, honorable, and holy because it was an institution of God, though he remained uneasy about its pleasurable aspects. It should be added here that Judaism had a much more positive view of sex than Christianity, one attuned to the Talmud, which regarded sexuality as a normal aspect of life.

Enter the Unbelievers. Though a significant portion of the Christian population failed to live up to the Christian sexual ideal—and though even Augustine ended up accepting prostitution as a necessary evil—it was not until the seventeenth and eighteenth centuries that a serious challenge was raised against some of the basic Christian assumptions regarding sex. In England one of the main factors was a reaction by those segments of the population who opposed Puritan attempts to enforce conformity to their ideals. After the fall of the Puritans, the sexual licentiousness of the Restoration court of Charles II created an opening for wider public discussion of sexual matters.

But public discussion of sexuality was not limited to England; it was taking place across much of Europe, fueled in part by growing awareness that other peoples and cultures had quite different sexual customs and ideas. Travelers, explorers, and settlers reported on the way things were done in India, China, the Americas, and elsewhere, further encouraging a new examination of traditional beliefs. The growth of the secular state led to increasing control by the state rather than the church, making possible new challenges to church domination over the regulation of sexual behavior. The growing willingness of many to challenge existing beliefs about the

world in general is exemplified by the new scientific discoveries of GALILEO, Sir Isaac Newton, and others, discoveries that forced religious authorities to reexamine some of their basic assumptions.

One result of this ferment was a growing sense that men and women should follow their natural instincts, not just do what church authorities told them. Nature, it was believed, prescribed a reason and a place for everything, and this could be determined by REASON and observation. The most prominent advocates of these new ideas were the French philosophes, who sought to apply reason to every phase of life, even sexuality, in order to undermine superstitious religious beliefs. Denis DIDEROT, for example, complained that religious institutions had "attached the labels of 'vice' and 'virtue' to actions that were completely independent of morality." He called for a return to the "natural man."

The difficulty faced by such challenges to traditional religious beliefs about sexuality was that the advocates of change had no evidence to disprove traditional ideas except their own logical thinking. They could question traditional sexual values and beliefs, but they were not certain what should replace them. VOLTAIRE in his *Philosophical Dictionary* (1764) challenged traditional Christian ideas about "Socratic Love" (homosexual love). He wondered how it was possible that it could be such an evil vice that threatened to destroy the human race, if when generally practiced it appeared to be such a natural act, as Plato and others had declared it. Though Voltaire ended up opposed to laws against morals, the philosophes were very much people of their own time. Jean-Jacques ROUSSEAU, in his *Confessions* (1781-88) wrote that he had masturbated, but never managed to eliminate his guilt feelings: "Even after the marriageable age, this odd taste, always increasing, carried even to depravity, even to folly, preserved my morals well, the very reverse of what might have been expected."

The critics achieved a major victory with the enactment in 1804 of the Napoleonic Code, which removed many sexual activities (including same-sex partnerships) from the roster of crimes. This action by France served as a model for many other countries. Sexual attitudes, however, have not only been influenced by religion, philosophy, and law, but also by medicine. The eighteenth-century attack on Chrisitian sexual beliefs by unbelievers would be undermined by those who claimed scientific backing for maintaining a more restrictive stance. The source of this attack was a growing fear of the "dangers" of masturbation. In the minds of many these dangers extended to all forms of nonprocreative sex. The attack originated with an anonymous Grub Street publisher in London who, at the very time the French philosophes were at their height, published *Onanism*, a book on masturbation that became an international best seller. (Onan was an Old Testament character whom God struck dead not because he masturbated, but because he practiced withdrawal during sex so as to avoid impregnating his late brother's wife, as tribal law required of him. His violation was his refusal to get his sister-in-law pregnant.)

Though Onan's action was not masturbation, his spilling of his seed was so interpreted by the Grub Street author, who proceeded to attribute all kinds of diseases to the practice. In a day when medicine could offer few causal explanations for any disease, masturbation came to be viewed as a major causal factor of disease and was seized upon by a large variety of writers, including physicians, as the base cause of many of the ills of the time. The fear of masturbation only began to ease at the end of the nineteenth century when the germ theory developed. Nonetheless, his name became enduringly associated with masturbation.

The physician who seized upon the anonymous booklet and gave it "scientific" justification was the distinguished Swiss doctor S. A. D. Tissot. Concerned with the "rising tide" of sexual immortality, Tissot published a 1758 book, also titled *Onanism*, that transformed the idea of masturbation as a cause of disease from a questionable folk supposition to one that enjoyed the backing of medicine as a whole. Tissot's book was based upon the ideas of the Dutch physician and chemist Hermann Boerhaave, who taught that physical bodies suffered from incessant wastage and this continuing loss was ultimately a cause of death. Tissot accepted Boerhaave's belief that this wastage included diarrhea, loss of blood, perspiration, and similar factors, but he added another class of wastage which he felt superseded all: the waste of semen through masturbation. Tissot held that waste of semen (or its equivalent in women) would lead to (1) cloudiness of ideas, sometimes even madness; (2) a decay of bodily powers, resulting in coughs, fevers, and consumption; (3) acute pains in the head, rheumatic pains, and an aching numbness; (4) pimples on the face, suppurating blisters on the nose, breast, and thighs, and painful itching; (5) eventual weakness of the power of generation as demonstrated by such things as impotence, premature ejaculation, gonorrhea, priapism, and tumors in the bladders; and (6) disordering of the intestines, resulting in constipation, hemorrhoids, and other ailments.

Tissot's critics were hard put to disprove his argument, which was extended by many to include all nonprocreative sex. Numerous other writers (both medical authorities and moral crusaders) added to Tissot's litany of the sequellae of masturbation. All kinds of devices were patented to prevent masturbation in children, held to be its most likely victims, although women were considered particularly vulnerable as well.

The whole edifice built upon assumptions that masturbation caused disease eventually came crashing down—due to the discovery of bacteria and germs by Louis Pasteur and others, the acceptance of the concept of infection, the development of asceptic techniques, and the rise of twentieth-century medicine. But it would

take time to reverse the effects of more than a hundred years of negative campaigning. Throughout the nineteenth century there had been dissenters from the general belief in the dangers of masturbation, but until the rise of germ theory they had no way to prove their opponents wrong. Still, freethinkers such as Jeremy BENTHAM, John Stuart MILL, and Henry Sidgwick had argued for, among other things, tolerance of homosexuality. Giving impetus to the challenge was a newly developing field of sexual research that itself involved a large number of freethinkers. Havelock Ellis, Magnus Hirschfeld, Sigmund FREUD, and, later, Alfred Kinsey, all freethinkers if not atheists, led the battle. Carrying the message of the researchers to a wider public were freethinkers such as publisher Emanuel HALDEMAN-JULIUS, whose Little Blue Books were the main source of sex information for vast numbers of Americans in the 1920s and 1930s. Later, humanists (see HUMANISM) such as Lester Kirkendall and Mary Calderone led the struggle for better sex education in the schools. Margaret SANGER, the daughter of a freethinking father and herself an early humanist and a founder of the Planned Parenthood movement, carried on the struggle to impart accurate sex information (see BIRTH CONTROL AND UNBELIEF). One of the most receptive audiences for new ideas about sexuality was the readership of the AMERICAN HUMANIST ASSOCIATION magazine the *Humanist*, edited by Ed Wilson and later by Paul Kurtz, who also founded *Free Inquiry*. In fact it was, in part, the perceived leadership of humanists in the sexual revolution of the late 1960s and early 1970s that led the Moral Majority and its allies to look upon SECULAR HUMANISM as the causal factor in changing American morals. Unbelievers were never alone in their efforts, and they were often joined by indviduals and groups representing organized religion. Their battle, however, is far from over.

SHAFTESBURY, ANTHONY ASHLEY COOPER, THIRD EARL OF (1671–1713), British writer and deist. Brought up by his politician grandfather, the first Earl of Shaftesbury, and tutored by John LOCKE, whom he greatly respected without uncritically following him, Anthony Ashley Cooper, third Earl of Shaftesbury, was kept from active political life by crippling and finally fatal asthma. He disliked abstract metaphysics, though occasionally making telling points, for example, that hard as it was to see how matter could generate mind, it was equally hard to see how mind could generate matter. Rejecting both the materialism and the egoism of Thomas HOBBES, he considered philosophy useless unless it told us how to live, and he emphasized the role of feeling and sensitivity, often appealing to emotions to supplement rational argument.

Ethics. Shaftesbury is most famous for introducing the moral sense theory whereby we detect good and evil, right and wrong, much as we detect beauty—recognizing them directly rather than by deducing them from premises, whether theological or other. But systematic development only came later, and he was so keen to stress the objectivity of values, both moral and aesthetic, and the need for taste to be trained, that this "sense" often verges on rational intuition, and it is unclear just what is intuited. A tension also seems to arise when Shaftesbury insists both that virtue and self-interest ultimately coincide, and that virtue must be chosen for its own sake. But this is only apparent: virtue will indeed benefit us—but only if not chosen for that reason.

Religion. Shaftesbury's religious position is not entirely clear, partly perhaps because of then-current social and indeed legal constraints, though he deplored censorship as counterproductive. He certainly believed in a creative God, mainly because of the empirical evidence of design in the universe, but in interpreting this he relied heavily on a moral principle that the good of the whole must always supersede that of a part, so that the evil we see around us becomes merely apparent if it is needed for a greater good—as he rather optimistically assumed it was. Emphasizing order and reason, he decried appeal to miracles and argued that revelation presupposed rational proof of God for its own authenticity. His virtual silence on specifically Christian doctrines means that Shaftesbury is often called a deist (see DEISM), though some doubt this because of his ambiguous attitude toward nature, which he sometimes seems to equate to God.

ALAN LACEY

SHAKESPEARE, RELIGIOUS SKEPTICISM IN. Born in 1564, William Shakespeare belonged to a generation that had never known an undivided Christendom: the biblical promise that there would always be an "eternal" and "visible" church had failed. The 1590s, when young Shakespeare matured as a dramatist, were marked (or disfigured) by extreme religious intolerance, in England and across Europe. For reasons that were more obviously political than religious, each of the confessions set about "unchurching" its rivals, insisting that it alone was the necessary instrument of individual salvation, and denying that any devout Christian was in a position to determine privately which was the "true" church, or "Bride of Christ." John Donne's blistering "Satyre III: Of Religion," which was written in the mid-1590s but for obvious reasons circulated only privately, characterized these rival confessions as whores pretending to be the promised "Bride of Christ." Donne's anger followed from his (Christian) conviction that the whorish pretenders' mutual intolerance would drive men into disbelief. In this respect Donne's poem provides an excellent introduction not only to the oppressive religious climate of the 1590s but to *Hamlet*, with its peculiarly troubling Ghost. "Remember me," says the Ghost, but nineteenth- and early twentieth-century critics who speculated about Hamlet's reasons for "delay" kept forgetting the most important reason. Hamlet is intermittently shaken by the thought that the Ghost may be a "damned goblin" or instrument of damnation, sent to take advantage of Hamlet's melancholy; if, on the other hand, the Ghost really is the ghost of Hamlet's father then Purgatory exists, which Protestants denied. If Hamlet is right to appeal to "Saint Patrick"—the patron saint of Purgatory—Protestant England, as well as Protestant Denmark, was in deep trouble.

Several modern scholarly studies have shown how thoroughly Shakespeare knew his (Genevan) Bible; as Tom Bishop shows in an excellent survey, this has been a fertile area of investigation in which much work remains to be done on how such knowledge fueled Shakespeare's creative imagination. But discussions regarding what religious beliefs, if any, Shakespeare may or may not have held have always been unconvincing or inconclusive, for two quite different reasons.

First, the surviving documentary and historical evidence that is assembled and examined at length in Samuel Schoenbaum's *Shakespeare's Lives* is too woefully sparse to yield any firm conclusions, although determined speculators have used this "evidence" as drunks use lampposts, for support rather than illumination. Here it should be noted that even if Shakespeare was *once* a Lancastrian Catholic (a popular speculation, at present), this would not establish whatever the later author of *Hamlet* and *King Lear* believed. Ben Jonson's and John Donne's overlapping circles of friends included many so-called "double converts." Just as our modern notions of "ATHEISM" can be misleading if we forget that Renaissance science offered no alternative account of creation, our modern notion that religious "conversion" involves changing one's beliefs can be misleading, if we forget how many Christians changed their minds about which of the changing institutions could best accommodate their unchanged religious beliefs.

Second, Shakespeare's plays provide little evidence of his own beliefs because they are so markedly and (even by the standards of his own time) peculiarly perspectival. It is not so difficult to establish what Ben Jonson—or Bernard SHAW and Henrik Ibsen, or Gotthold LESSING and Bertolt BRECHT—think about the issues their plays explore. But Shakespeare habitually shows how differently his different characters see, and think or feel about, their different situations, or about issues like honor, the divine right of kings, or religion itself. Once again, countless determined critics and interpreters have made light of this difficulty by supposing that they somehow just know when Shakespeare is ventriloquizing through one character rather than another, and know whether their "Shakespeare" agrees with the mutually exclusive points of view of, say, Prospero and Caliban, or Shylock and Portia. Shakespeare is now the world's most performed dramatist; neither the history of Shakespeare criticism nor the history of the plays in performance vindicates, or even encourages, any confidently priestly or authoritarian claim to know whether Henry V or Michael Williams speaks with His Master's Voice. Moreover, because such claims are always striving to settle disputes by privileging one voice rather than another, in the distinctively Shakespearean plenitude of different, clamoring voices and views, such claims always work against the plays' power to excite or disturb audiences.

Shakespeare's SKEPTICISM, like Michel de MONTAIGNE's, was almost always radical, not terminal or dogmatic. True, young Shakespeare seems to have tried, to the best of his ability, to defend (or at least not to oppose) the Tudor myth of the divine right of kings in his first historical tetralogy; but he gave up. *King John*, which so few critics discuss, may provide some indirect record of the loss of an illusion not worth having, since it is fiercely and, for Shakespeare, unusually anti-Catholic. The second tetralogy is radically skeptical and perspectival, like the tragedies and "problem" comedies that followed *Hamlet*. *Troilus and Cressida* makes a comedy out of the intellectually demanding proposition that there are no objective values, and that, as Hamlet puts it, "There is nothing either good or bad, but thinking makes it so." In *Measure for Measure*, which followed a little later, Shakespeare was more concerned with the incompatibility of different absolute values, like those of the perfectly matched Isabella and Angelo: there is no possible way of reconciling the different claims of legal, moral, and divine "justice."

Atheistic sentiments are difficult to track in this period, since atheism was so severely punished: as David Berman shows, anti-atheistic tracts precede *published*

professions of atheism by more than two centuries. Indirect evidence is to be found in the Public Records Office, where there are letters from priests complaining that they are spat upon or stoned in their villages; or in edifying, officially approved narratives of conversion, when writers like John Bunyan or Richard Baxter describe the climate of unbelief from which they (God be praised) emerged; or in drama, when villains like Shakespeare's Iago or Edmund can profess their unbelief because they are villains. But *Measure for Measure* includes an unforgettable portrayal of a decent, casual atheist in Isabella's condemned brother Claudio, who believes that when we die, we go "we know not where."

GRAHAM BRADSHAW

SHAW, GEORGE BERNARD (1856–1950), Anglo-Irish playwright and critic. With such plays as *Man and Superman*, *Major Barbara*, *Caesar and Cleopatra*, *Arms and the Man*, *Saint Joan*, and *Pygmalion*, the expatriate Irishman George Bernard Shaw forged a grand repertoire in English second only to William Shakespeare's (see SHAKESPEARE, RELIGIOUS SKEPTICISM IN). He was awarded the Nobel Prize in Literature in 1923.

ATHEISM. Until he was thirty or so, Shaw called himself an atheist. He adjudged the doctrines of the Church of Ireland, which he attended in childhood, unintelligible. Since the first of its thirty-nine articles describes God as "without body, parts, or passion," Shaw waggishly inferred that the church was atheistic; an incomprehensible God was tantamount to no God. In 1875 he blazoned his atheism abroad in a letter to *Public Opinion*, a Dublin newspaper. To save Shaw from hellfire, a friend prevailed on a Roman Catholic priest to catechize the upstart atheist. When the priest contended someone must have created the universe, since it exists, Shaw replied: "It is as easy for me to believe that the universe made itself as that the maker of the universe made himself, in fact much easier; for the universe visibly exists and makes itself as it goes along, whereas a maker for it is a hypothesis."

Shaw scoffed at superstition, churches, ecclesiastics, rituals, ceremonies, and creeds. In *The Adventures of the Black Girl in Her Search for God*, he derided the myopic sectarianism that strews dissension among Christians. He depicted the God of Abraham and Moses as a boastful, imperious, and sanguinary fiend. While Jesus fared better than Yahweh, Shaw impugned the doctrines of atonement and universal love. Atonement he described as "a means by which we cheat our consciences, evade our moral responsibilities, and turn our shame into self-congratulation by loading all our infamies on to the scourged shoulders of Christ." Shaw deemed it psychologically impossible to love everyone.

Mysticism and the Life Force. In the 1890s Shaw renounced atheism and repackaged himself as a mystic. He now characterized atheists as "superficial and light-minded." His renunciation of atheism was accompanied by sallies against scientific MATERIALISM, especially DARWINISM, which he believed to hold "that every act of pity or loyalty is a vain and mischievous attempt to preserve inferior varieties from the efforts of nature to weed them out."

To combat Darwinism, Shaw preached "the Gospel of Shawianity." He evangelized for an idiosyncratic version of Henri BERGSON's emergent evolution. From the first decade of the twentieth century to the end of his life, in speeches, essays, stories, letters, and plays, Shaw expatiated on the "life force" —a mysterious power immanent in living matter that supposedly drove evolution. Shaw reified the power as an inchoate deity struggling to actualize itself in organisms. Every species had been an instrument of its effort to acquire power, knowledge, understanding, and empathy. In its odyssey to achieve fruition, the life force would create ever-higher forms of humanity—supermen, super-supermen, supermen to the third power. By evolving into omniscient, omnipotent, and omnibenevolent beings, humans would create God.

Critique. Shaw adduced no evidence in favor of the life force, other than an extraneous insistence that Darwinism was incompatible with hope, aspiration, and altruism. He merely postulated the existence of the force and described its modus operandi. When Shaw invoked the life force to explain the course of evolution up to the present, he violated Occam's razor, the principle of parsimony in hypotheses, since what the life force purports to illuminate can be illuminated without it. When he described the future course of evolution, he revved up his propensity for wild surmise.

Shaw's motive for believing in the life force was more emotional than intellectual. The conviction that virtue and wisdom will ultimately vanquish wickedness and ignorance justified his humanitarian zeal, bulwarked his native optimism, and quieted his inner demons. Shaw was a mixture of Mephistopheles and Jesus Christ. Though he ridiculed churches, clerics, and anthropomorphic gods, he retained the moral fervor of his Protestant heritage. When hawking the life force, he was a holy prophet pitching the Kingdom of Heaven.

SHELLEY, PERCY BYSSHE (1792–1822), English poet. Percy Bysshe Shelley was born on August 4, 1792, the oldest son of Timothy Shelley, a Whig member of Parliament. In 1804 he was sent to Eton; in 1810 he went to University College, Oxford. He was expelled on March 25, 1811, for his coauthorship of the pamphlet *The Necessity of Atheism*. In August he eloped with and married Harriet Westbrook. In 1812 he began to correspond with William GODWIN, author of *An Enquiry concerning Political Justice* (1793), and to pamphleteer in Ireland and England for religious and political reform. In 1812 he printed and distributed *Queen Mab*, "A Philosophical Poem," a denunciation of tyranny and religion. In June 1812 Harriet gave birth to a daughter, Ianthe (named after the heroine of *Queen Mab*). In 1814 Shelley privately published *A Refutation of Deism*. He began a relationship with Mary Wollstonecraft Godwin, the daughter of Godwin and of Mary WOLLSTONECRAFT, author of *A Vindication of the Rights of Women* (1792), eloping with her on July 28, 1814. In November, Harriet and Shelley's second child, Charles, was born. In February 1815 Mary gave birth prematurely to a daughter who died unnamed; and in January 1816 she gave birth to a son, William. In May 1816 Shelley and Mary traveled to Lake Geneva, where Shelley began his relationship of reciprocal influence and uneasy but profound friendship with Lord BYRON. In June Mary began writing *Frankenstein*. Shelley wrote the poems "Hymn to Intellectual Beauty" and "Mont Blanc"; in hotel registers in Chamonix he signed himself in Greek as "democrat, philanthropist and atheist." Shelley and Mary returned to England in September. On December 10, Harriet committed suicide by drowning herself. Shelley married Mary on December 30, and attempted without success to gain custody of his and Harriet's children. Shelley and Mary became close friends of Leigh Hunt and acquainted with John Keats. In September Mary gave birth to a daughter, Clara. Shelley wrote, among other political pamphlets and philosophical essays, the unfinished "Essay on Christianity," which distinguishes Christ from the ignorance and fanaticism of his followers. Shelley's epic poem, *Laon and Cythna*, was published in December 1817; censored, it was republished as *The Revolt of Islam* in January 1818.

On March 11, 1818, Shelley left England for Italy. This was a period of unsettled traveling and of further personal suffering. The Shelleys' children died: Clara in May 1818, and William in June 1819. Shelley, however, remained very active creatively, depicting his renewed friendship with Byron in *Julian and Maddalo*, and expressing his radical views on religion, morality, and politics in a variety of essays and poems, including the "Lyrical Drama" *Prometheus Unbound*, the blank-verse play *The Cenci*, the balladic invocation *The Mask of Anarchy*, the sonnet "England in 1819," "Ode to the West Wind," the unfinished treatise "A Philosophical View of Reform," and the "Essay on the Devil, and Devils," satirizing Christian mythology, all written in 1819. Percy Florence (the only one of Mary and Shelley's children to survive him) was born in November 1819. Between 1819 and 1822 Shelley wrote several of his most significant and substantial works, including "Ode to Liberty"; *Epipsychidion*; his poetic credo *A Defence of Poetry*; *Adonais*, an elegy for Keats who had died in Rome in February 1821; his final major published poem *Hellas*; and his last-written poem, *The Triumph of Life*, unfinished when he died. At the end of April 1822, the Shelleys moved to near Lerici in the Bay of Spezia. In June Leigh Hunt arrived in Italy to join Byron and Shelley in the production of an antiestablishment journal, the *Liberal*; and on July 1, Shelley sailed to Leghorn in his own boat to meet with Hunt. On the return voyage, the boat sank in a sudden storm and Shelley drowned. His body, washed ashore on July 18, was exhumed and burned on a pyre on August 16. His ashes were placed in the Protestant Cemetery in Rome in 1823.

It is only since the latter half of the twentieth century that the range of Shelley's writings has become widely accessible. Despite recognition of his heterodoxy, there has been reluctance to acknowledge his ATHEISM. Although other terms can, with discrimination, be applied appropriately to Shelley's beliefs, David Berman has persuasively argued that *The Necessity of Atheism* and *A Refutation of Deism*, at least, are atheistic works; and that Shelley is of major importance as only the fourth-published speculative atheist in British intellectual history. In both texts, Shelley's position is primarily epistemological, derived from the empiricism of John LOCKE, the skepticism of David HUME, and from both Classical philosophers and Enlightenment philosophes (see ENLIGHTENMENT, UNBELIEF DURING THE). *The Necessity of Atheism* argues "that there is no proof of the existence of a Deity," and *A Refutation of Deism* presents in dialogue the arguments of a deist and a Christian that are mutually confounding. In many of Shelley's writings in prose and verse, his epistemological position compounds with an ethical and political stance: not only berating Christian belief as irrational and ignorant superstition, but also indicting Christianity as practiced deception, in service to despotic power.

An early letter allows one to savor Shelley's libertarian viewpoint at its most vehement and lively: "And

Liberty! Poor liberty, even the religionists who cry so much for thee, use thy name but as a mask, that they also may seize the torch, & shew their gratitude by burning their deliverer. *I* should doubt the existence of *a* God, who if he cannot command our reverence by *Love*, *surely* can have no demand upon it from Virtue on the score of terror. It is this empire of terror which is established by Religion."

GEORGE EDWARD DONALDSON

SHROUD OF TURIN, BELIEF IN. Of some forty alleged shrouds of Jesus that have appeared over the centuries, the most seriously promoted is a fourteen-foot length of linen kept in Turin, Italy, in the Roman Catholic Cathedral of Saint John the Baptist. Uniquely, it bears the front and back images of a bearded and apparently crucified man. Believers insist it is the actual burial wrapping of Jesus, stained with his blood.

The supposed relic first surfaced at a little church in the village of Lirey, in north-central France, ca. CE 1355. It was in the possession of one Geoffroy de Charny, who never explained how he, a man of relatively modest means, had acquired the most holy relic in Christendom. At that time, it was being used as part of a faith-healing scheme to bilk credulous pilgrims. Subsequently, however, the local bishop, Henri de Poitiers, "discovered the fraud and how the said cloth had been cunningly painted, the truth being attested by the artist who had painted it," as stated in a later bishop's report to Pope Clement VII, dated 1389. (Clement was the Avignon Pope, the first of the antipopes in the Great Western Schism.)

In 1532 the shroud had to be rescued from a fire that consumed its chapel in Chambéry. A blob of molten silver from the reliquary penetrated the cloth's multiple folds, resulting in the burn marks. Eventually, in 1578, in a shrewd political move to relocate the capital of the Savoy duchy, the shroud was transfered to Turin.

The modern history of the shroud began in 1898 when its shadowy image was first photographed by Secondo Pia. The negatives returned an image that looked more realistic in its distribution of highlights and shadows, indicating that they were approximately reversed on the cloth. How, shroud proponents began to ask, could a mere medieval forger have produced a perfect photographic *negative* long before the invention of photography?

In fact, the image is a *quasi*-negative, the darks and lights being only *approximately* reversed. For instance, in the "positive" image shown on a photo negative, the figure's hair and beard are white—the opposite of what would be expected for a Palestinian Jew of Jesus's age. The effect would be consistent with an *imprint*.

However, experiments demonstrated that simple contact imprinting could not have produced such a harmonious image. A genuine body imprint would have had severe wraparound distortions—an inevitable fact of geometry—and other flaws.

Other "theories" about the image-forming process ranged from the discredited to the fantastic. For instance, a concept called vaporography was disproved when the postulated vapors produced only a blur. One scientist opined that the image was caused by "flash photolysis"—that is, a burst of radiant energy, supposedly yielded by Christ's body at the moment of resurrection.

Better photographs made available in the 1930s prompted shroud enthusiasts, like the French Catholic surgeon Pierre Barbet, to insist that certain anatomical elements and realistic "blood" flows represented details beyond the knowledge and abilities of a medieval forger. Skeptics countered that a bloody footprint on the cloth was anatomically incompatible with the image of the leg belonging to it; that the features were unnaturally elongated (like figures depicted in Gothic art); that the hair falls as for a standing rather than recumbent figure; that the blood had failed to mat the hair and was unnaturally picture-like; and that the blood had remained red, unlike old blood, which blackens with age.

Physical tests of the shroud were first carried out by an official, originally secret commission between 1969 and 1976. Two of the experts specifically questioned the provenance of the cloth and suggested it was an artwork made by some imprinting technique. Also, a pair of internationally known forensic serologists extensively tested "blood"-stained threads, but the red substance failed all of them: standard preliminary analyses, addi-

tional tests for hemoglobin, microscopic examination for blood corpuscles, and sophisticated instrumental analyses. Another expert, Professor Silvio Curto, discovered traces of what he believed was paint.

In 1978 a further examination was conducted by the Shroud of Turin Research Project (STURP) whose leaders, unfortunately, served on the executive council of the proauthenticity Catholic organization, the Holy Shroud Guild. Many STURP scientists indicated their proshroud bias before examining the cloth.

An exception was a world-famous microanalyst, Walter C. McCrone. He performed a "blind" microscopic study of samples that had been lifted from the cloth by sticky tape and placed on microscopic slides. McCrone found significant amounts of the pigment red ocher (red iron oxide) on image areas, but not on off-image ones. He first thought the pigment was applied as a dry powder but later concluded it was a component of a diluted paint applied in the medieval grisaille (monochromatic) technique.

He identified the "blood" as tempera paint, composed of red ocher and vermilion pigments in a collagen binding. He performed the identification by microchemical and instrumental analyses. For his efforts, McCrone stated, he was "drummed out" of STURP.

McCrone was replaced by two scientists, John Heller and Alan Adler, who soon challenged McCrone's findings as well as those of the commission's forensic experts. The pair claimed to have "identified" the presence of blood on the shroud. Unfortunately, neither was a forensic serologist, nor a pigment expert, raising the serious question of why they were selected to perform the analyses.

Forensic analyst John F. Fischer reviewed Heller and Adler's claims and observed that none of their tests was specific for blood, that their approach (an attempt to add together individual aspects, such as the presence of iron and protein) was not a forensically acceptable method of identifying blood, and that similar results might be obtained from tempera paint.

Skeptics of the shroud's authenticity were vindicated in 1988 after three laboratories (at Oxford, Zurich, and the University of Arizona) carbon-dated samples of the cloth. Using accelerator mass spectrometry, the labs obtained dates in very close agreement: The age span was circa CE 1260–1390, and it was given added credibility by correct dates obtained from a variety of control swatches.

Shroud proponents responded to the devastating carbon-14 test results with a variety of rationalizations. Some claimed the cloth samples had been taken from a patch, or that the imagined burst of radiation at Jesus's resurrection had altered the carbon ratio. Some accused the scientists of deliberate fraud. Another researcher offered a seemingly more scientific explanation when he claimed a microbial "varnish" had contaminated the cloth and skewed the radiocarbon date; however, for the date to have been altered by thirteen centuries, there would have to be twice as much contamination, by weight, as the cloth itself.

The accuracy of the radiocarbon dating is supported by other, corroborative evidence for the shroud's medieval origin. This includes a study of iconographic elements. By the eleventh century, artists had begun to depict the shroud as a single double-length cloth, although actual Jewish burial practice (as related in John 20:5–7) utilized multiple cloths. And by the thirteenth century we find ceremonial shrouds bearing full-length images of Jesus's body in death. In these, as in the Turin image, the hands are discreetly folded over the loins, an artist's motif that itself dates from the eleventh century. Found together in the Shroud of Turin, these traditions suggest it is the work of an artist of the thirteenth century or later. And, in fact, the long, thin forms of the figure are typical of French gothic art of the fourteenth century.

Among post–radiocarbon test claims about the Shroud of Turin is the allegation that human DNA was found in a shroud "blood" sample. Actually the scientist cited, Victor Tryon of the University of Texas, stated, "All that I can tell you is that DNA contamination is present and that the DNA belonged either to a human or another higher primate. I have no idea who or where the DNA signal came from, nor how long it's been there." He does not say it came from blood. As he observed, "Everyone who has ever touched the shroud or cried over the shroud has left a potential DNA signal there." Tryon resigned from a shroud project in the wake of exaggerations about his findings, disparaging "zealotry in science."

Still other claims concerned floral evidence. It was alleged that pollen on the shroud proved it came from Palestine, but the source for the pollen claim was a freelance criminologist, Max Frei, who once pronounced the forged "Hitler diaries" genuine. Frei's tape-lifted samples from the shroud were controversial from the outset, since similar samples taken by the Shroud of Turin Research Project in 1978 had comparatively little pollen. As it turned out, when Frei's tapes were examined following his death in 1983, they also had very little pollen—although one bore a suspicious cluster on the "lead" (or end), rather than on the portion that had been applied to the shroud. Accompanying the unscientific pollen evidence were claims that faint plant images have been "tentatively" identified on the shroud. These follow previous "discoveries" of "Roman coins" over the eyes and even Latin and Greek words, such as "Jesus" and "Nazareth," that some researchers see—Rorschach-like—in the shroud's mottled stains.

In recent years, the Shroud of Turin has been linked to another notorious cloth, the Sudarium of Oviedo, which some believe was the "napkin" that covered Jesus's face. However, the Sudarium lacks a facial image, and its presence would have prevented such an image from forming on the shroud. Also, the supposed matching of the bloodstains on the Turin and Oviedo cloths is but another exercise in wishful thinking. As to the alleged

matchup of pollens, once again the evidence comes from the questionable tapes of Max Frei.

A desire to believe the Shroud of Turin is authentic—supported by rationalizations and questionable evidence—propels shroud enthusiasts' agenda. They offer one explanation for the contrary gospel evidence (*maybe* certain passages require clarification), another for the lack of historical record (*maybe* the cloth was hidden away), still another for the artist's admission (*maybe* the reporting bishop misstated the case), yet another for the paint pigments (*maybe* an artist who made a copy of the shroud ritualistically pressed it to the image), and so on. This should be called the "maybe" defense. It is all too characteristic of shroud advocacy, which has failed to produce any scientifically viable hypothesis for the image formation.

In contrast, the scientific approach is to allow the preponderance of prima facie evidence to lead to a conclusion: The shroud is the handiwork of a medieval artisan. The various pieces of the puzzle effectively interlock and corroborate each other. For example, the artist's admission is supported by the lack of prior record, as well as by the revealingly red and picturelike "blood" that, in turn, has been identified as tempera paint. And the radiocarbon date is consistent with the time the artist was discovered.

Given this powerful, convincing evidence, it is well to recall the words of Canon Ulysse Chevalier, the Catholic historian who brought to light the documentary evidence of the shroud's medieval origin. As he lamented, "The history of the shroud constitutes a protracted violation of the two virtues so often commended by our holy books: justice and truth."

SILVER, QUEEN (1910–1998), American freethinker, feminist, and labor radical. Queen Silver was born on December 13, 1910, in Portland, Oregon. Her fame as a prominent advocate for atheism began during her childhood. Indeed, the legendary film producer Cecil B. DeMille called her "the Godless Girl" in a 1929 Hollywood movie of that same title whose main character was modeled after Queen and her organization, the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM.

Queen attended her first political rally at six days old. Her mother and fellow atheist Grace Verne Silver had interrupted a lecture tour on labor laws only long enough to give birth. Political agitation was a tradition for the Silver women. Queen's grandmother, Azuba, had been a vocal opponent of child labor. Thus, Queen delighted in introducing herself as "a second generation freethinker, a third generation feminist, and directly descended from framers of the Constitution."

At eight years old—and already a veteran soapbox speaker at the Free Speech Zone on Los Angeles Street in Los Angeles—the diminutive Queen stunned Los Angeles crowds by delivering a series of six lectures sponsored by the London Society of Science. The subjects ranged from Darwinian evolution to Einstein's new theory of relativity. In announcing one 1919 lecture, the *Los Angeles Recorder* wrote, "A good share will be extemporaneously delivered. She has already traveled 50,000 miles in work on the stage and lecture platform." Queen's lectures drew hundreds of people; hundreds more were turned away at the door.

Her most famous lecture and pamphlet, titled "Evolution, From Monkey to Bryan" (1923), was addressed to William Jennings Bryan, the prosecutor in the Scopes monkey trial (see DARROW, CLARENCE; EVOLUTION AND UNBELIEF). *Queen Silver's Magazine*, a freethought periodical she both published and edited, showcased the teenager's lectures and attracted more than five thousand subscribers worldwide.

Queen was also an activist. Late in 1925, Grace physically attacked an aggressive evangelist and was arrested for assault and battery. Queen acted as her mother's lawyer. Headlines in the *Los Angeles Evening Express* declared, "Modern Portia of 14 Fights for Mother Before Court." Queen won.

Queen and Grace were also active in the labor organization Industrial Workers of the World. As a result, Queen witnessed considerable police violence against dissidents. She also witnessed the destruction of Grace's bookstore—the first socialist and freethought bookstore in Los Angeles—which was raided three times by the

American Legion while the police stood by.

When Grace's health deteriorated badly in the mid-1930s, Queen withdrew from radicalism to become a clerk at the Department of Motor Vehicles. She eventually became one of the first woman court reporters in California.

When Grace died in 1972, Queen returned to a political advocacy that revolved around freethought, women's rights, and defending the First Amendment. She remained active in atheist circles in Los Angeles, often performing low-glamour work such as taking records or stuffing envelopes. She died on January 7, 1998.

WENDY MCELROY

SINCLAIR, UPTON (1878–1968), American novelist. Upton Sinclair was born in Baltimore, Maryland, to Upton Beall Sinclair and Priscilla Sinclair. Upton Sr. was an alcoholic and died in 1907. Owing to his mother's piety, Upton Jr. had a deeply religious upbringing and was confirmed in the Episcopal Church at age twelve. Christian morality remained strong in Sinclair all his life, and he believed that true Christianity would eventually prevail, although he rejected organized religion. Sinclair's three main influences were Jesus, *Hamlet*, and the poet Percy Bysshe SHELLEY.

Sinclair enrolled in City College of New York when he was fourteen. After graduating in 1897, he spent three years at Columbia University, taking social science and humanities courses. He began writing small items such as jokes and captions for newspapers and magazines.

Introduced to socialism in 1902 by Leonard Abbott, Sinclair cofounded with Abbott the Intercollegiate Socialist Society (later the League for Industrial Democracy). He ran for congress as a Socialist three times and lost. In California he founded a political action group, End Poverty in California (EPIC), and ran on the Democratic Party ticket for governor in 1934, losing to the Republican candidate by a narrow margin.

In 1915 Emanuel HALDEMAN-JULIUS gave a favorable review in the *New York Call* of one of Sinclair's books, after which Sinclair became a regular contributor to Haldeman-Julius's *Appeal to Reason*, the *Haldeman-Julius Weekly*, *Monthly*, and *Quarterly*, as well as many of the Little Blue Books.

In Sinclair's *The Profits of Religion* (1918) he denounced established religious institutions for their corruption and their exploitation of the poor, especially targeting the Catholic Church. But Sinclair was no rationalist; he took his belief in the occult very seriously. In this book he also espoused "mental healing," claiming to have the psychic ability to heal by placing his hands on people.

An unhappy marriage to Meta Fuller resulted in a son, David. During this time, he was commissioned to write *The Jungle*, and spent two months in Chicago at the stockyards. The book, first published serially in *Appeal to Reason*, prompted Theodore Roosevelt to call upon Congress to pass the Pure Food and Drug Act and the Meat Inspection Act.

Sinclair won the Pulitzer Prize in 1943 for his *Dragon's Teeth*, the third novel in his Lanny Budd series. His many novels, such as *The Moneychangers* (1908), *King Coal* (1917), and *Oil!* (1927), remained true to his socialist ideals. A year before his death, Sinclair moved to Bound Brook, New Jersey, to be near his son.

JULIE HERRADA

SKEPTICISM. Various forms of skepticism have emerged through history. The term derived originally from the Greek word *skeptikos*, which means "to consider, examine." It is akin to the word *skepsis*, which means "inquiry" and "doubt." According to *Merriam-Webster's Collegiate Dictionary*, *skepticism* denotes "an attitude of doubt or a disposition to incredulity, either in general or toward a particular object." There are various shades of skepticism, from NIHILISM, which denies that any knowledge is possible, to the careful use of skepticism in the process of scientific inquiry. In the latter case, new forms of skepticism provide powerful analytic tools of criticism in science, philosophy, religion and the paranormal, morality, and politics.

Ancient Skepticism. Two explicit forms of philosophical skepticism appeared in the ancient world of Greece and Rome: Pyrrhonism and Academic Skepticism.

Pyrrhonism is a school of skepticism that took its name from Pyrrho of Elis (360–270 BCE) and influenced subsequent thinkers in the Greco-Roman world. Sextus EMPIRICUS, who lived in the third century CE, was the leading proponent of Pyrrhonism. His book *Outlines of Pyrrhonism* made a considerable impact on modern philosophy. In 1880 the historian Edward Zeller summed up Pyrrhonic skepticism as follows: "We can know nothing as to the nature of things. Hence, the right

attitude toward them is to withhold judgment. The necessary result of suspending judgment is imperturbability." Sextus, a medical doctor in his day, characterized Pyrrhonic skepticism as follows: It is *zetetic* (it is searching and examining) and it is *ephectic* (it involves a state of doubting). According to Sextus, the problem that we encounter in evaluating knowledge claims is that for every appearance (i.e., argument), we can find a contrary appearance or judgment. The only sensible solution is to suspend judgment, to neither affirm nor deny anything. Pyrrhonists do not seek to refute the claims of others; they are only saying that they neither believe nor disbelieve them. Thus Pyrrhonistic skepticism is excessive in its degree of doubt and is difficult to defend seriously today. It is impossible to live as a neutral person, for we need to make choices. Moreover, to deny the very possibility of knowledge is to ignore the considerable body of common sense and scientific knowledge that we possess. Many critics of Pyrrhonism find it to be dogmatic; it can easily lead to extreme negativism and nihilism.

A second school of skepticism that goes by the name Academic Skepticism emerged from PLATO's Academy in the third century BCE. Since we do not possess any of the writings of the Academic Skeptics, we must rely on secondhand sources. The Academic Skeptics attacked the metaphysical doctrines then prevalent, especially Platonism and STOICISM. According to CICERO, Arcesilaus used the term *epoché* to refer to the suspension of judgment in philosophical arguments. Arcesilaus introduced the doctrine of *eulogon*, which is to say the probable or reasonable, which provides us with some basis on which to make practical judgments, even though these are inconclusive and do not reveal to us the nature of reality. The views of Carneades are especially important, for he provided a constructive form of skepticism. He did not assume the neutralist suspension of judgment, but formed probabilistic judgments upon which we could act. Carneades did not think we could have knowledge about the nature of things, nor ultimate certitude. Nevertheless, some judgments are more probable than others. These are based upon empirical observations and inductive inferences, and the testing of beliefs in practice. It has been pointed out that Carneades could argue both sides of a question and illustrate the contradictory nature of judgmental claims; therefore the need for the suspension of judgment in such cases is prudent. Yet many of the scholars in the Academy argued for a *pithanon* approach, that is, a positive application of the skeptical method. These views are not unlike the *mitigated skepticism* of David HUME, which emerged in the modern world, and the use of skeptical inquiry by latter-day American Pragmatists (see PRAGMATISM).

Modern Skepticism. Skepticism became a major intellectual force in modern thought. The rediscovery of the writings of the ancient skeptics was important in the battle with dogmatic theology and speculative metaphysics. The use of skepticism led to the quest for a new method for understanding nature, and this paved the way for the birth of modern science. Writers such as Pierre BAYLE expressed the most thoroughgoing skepticism of the time. His influential *Dictionnaire Historique et Critique* presented scathing indictments of philosophical and religious theories. Many skeptics resorted to unlimited doubt, whether real or feigned. Thus RENÉ DESCARTES, often called the father of modern philosophy because of his search for a method, employed the technique of universal doubt, which was called "Cartesian doubt." This was not unlike the extreme form of ancient Pyrrhonistic skepticism. Descartes believed, however, that we could reach certainty by using the method of mathematics, wielding clear and distinct ideas and drawing deductive inferences from them in order to establish universal propositions. His RATIONALISM was rejected by empiricists, however, who thought that our knowledge of matters of fact was based on sense perceptions and empirical observations. John LOCKE, George Berkeley, and Hume attempted to resolve the central problem of modern epistemology: how ideas and/or minds could know external objects. In a sense the entire history of modern philosophy focused on the problem raised by the ancient skeptics: How was knowledge possible? What was the extent and limit of knowledge? What did this tell us about ultimate reality? This epistemological problem was exacerbated by the rapid development of Newtonian mechanistic and materialistic science, and its seeming conflict with our commonsense views of the world.

David Hume is no doubt the most influential skeptical philosopher of the modern world. He developed a form of *mitigated skepticism*. Wrestling with the challenge of Pyrrhonistic doubt, he argued that we develop knowledge about matters of fact based on sense impression. Our knowledge of causality is drawn from present observation, past experience, and the habit of expectation or custom, which allows us to make causal inferences. For Hume, although we cannot know ultimate reality, we do develop probabilities that can guide our conduct. Hume was a skeptic about the existence of God (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST), which he could not reconcile with the problem of evil (see EVIL, PROBLEM OF). His argument against miracles (see MIRACLES, UNBELIEF IN) rejected miracles on probabilistic grounds. It was reasonable to be skeptical of a miraculous claim because it conflicted with the regularities observable in nature.

Many other modern philosophers have been influenced by skepticism. Immanuel KANT attempted to combine both rationalism and empiricism. On Kant's view all knowledge has its origin in direct experience (phenomena), but this is structured or ordered by the forms of intuition and the categories of the understanding. Although knowledge of the phenomenal world was secure, Kant said, we cannot know the "thing in itself,"

in the noumenal world, nor could we prove the existence of God, freedom, or immortality.

The scientific revolution that began in the sixteenth and seventeenth centuries in the natural sciences was extended to the biological and the behavioral sciences and to technology in the nineteenth and twentieth centuries. It is widely conceded today that skepticism has an essential role to play in the course of scientific inquiry.

Pragmatic Doubt. Charles Sanders Peirce, an American Pragmatist philosopher, argued that inquiry begins where there is a state of real and living doubt. This is contextual. The quest for a belief to resolve doubt thus initiates inquiry. Scientific hypotheses need to be tested by means of a process of experimental confirmation and rational inference within an intersubjective community of inquirers. Such knowledge is fallible and open to modification in the light of new data and/or theories. This implies that any claims to knowledge need to be replicated before they are accepted. John DEWEY argued that the quest for certainty is elusive and illusive, but he thought that we could develop a progressive body of warranted assertions in the sciences. The methods of scientific inquiry, moreover, he said, were continuous with critical thinking in ordinary life and in making ethical judgments where we attempt to solve problems. Many skeptics have been influenced by Karl POPPER's nonfalsifiability principle (see FALSIFIABILITY). Popper suggested a demarcation line between science and pseudoscience. He said that a theory or hypothesis needs in principle to be falsifiable if it is to be considered scientific. He stated: "The criterion of the scientific status of a theory is its falsifiability, or refutability, or testability."

For contemporary skeptics there is thus an intrinsic relationship between inquiry and doubt. The process of investigation enables us to overcome doubt and develop a body of reliably tested hypotheses. Scientists need to be open to the possibility that new hypotheses may overthrow previously held theories. Science needs to test these hypotheses by rigorous standards of objectivity. Although modern skeptics believe that we can develop reliable knowledge in the sciences, they are unwilling to assert that we have reached any final formulation, and they are prepared to admit that any theory in time may be revised.

Skepticism has been used in all fields of human inquiry, especially in science and philosophy. In the area of religion skeptics tend to embrace either AGNOSTICISM, denying that there is sufficient evidence or proof for the existence of God, or ATHEISM, declaring that the existence of God has not been demonstrated by either argument or evidence. Even atheism connotes only the position that the existence of God is highly improbable, without foreclosing further inquiry. In ethics and politics, where practical judgments are at issue, some nihilistic skeptics take the position that there are no basic objective criteria and all ethical judgments are emotive (see LOGICAL POSITIVISM). Other skeptical inquirers have maintained, however, that there do exist rational considerations that are relevant, and that we can apply a "logic of judgments of practice" in evaluating their adequacy—though such skeptics likewise resist making absolute assertions.

The New Skepticism. Of considerable interest to classical and modern skepticism is the reemergence of a new skeptical movement in the twentieth century, which has focused on the scientific examination of "claims of the paranormal." The investigation of anomalous phenomena goes back to the examination of Franz Anton Mesmer and hypnotism at the end of the eighteenth century in France and England and Spiritualism and the Fox sisters in the United States in the nineteenth century (see SPIRITUALISM AND UNBELIEF). The founding of the British and American Societies for Psychical Research extended these studies to manifestations of mediumship, ghostly apparitions, claims for survivorship after death, and later parapsychological phenomena.

The establishment of the Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP) in 1976 and its journal, *Skeptical Inquirer*, greatly expanded the skeptical movement in the United States and worldwide. This form of skepticism began with the recognition that skeptical inquiry was intrinsic to scientific discovery and to the process of corroborating scientific hypotheses, and further that there was a considerable body of reliable scientific knowledge that provided a benchmark for testing truth claims scientifically. CSICOP attempted to find empirical and causal explanations for so-called paranormal phenomena such as alleged extrasensory perception (ESP), telepathy, precognition, faith healing, astrology, the Shroud of Turin (see SHROUD OF TURIN, UNBELIEF IN), miracles, alternative medicine, and even UFOlogical visitations and abductions.

These methods have been also employed by the Committee for the Scientific Examination of Religion (CSER), founded by the Council for Secular Humanism and its journal, *Free Inquiry*, and now operating under the auspices of the Center for Inquiry. CSER is interested in applying the best methods of skeptical scientific inquiry to the vigorous examination of the Old and New Testaments, the Qur'an, and other so-called sacred documents (see BIBLICAL CRITICISM; JESUS, HISTORICITY OF; BIBLICAL ERRANCY; ISLAM, UNBELIEF IN). It endeavors to use linguistics and to seek archeological, anthropological, evolutionary, genetic, biological, psychological, and sociological explanations throughout all aspects of inquiry into religion. Skepticism is thus brought directly to bear on *paranatural* phenomena, such as revelation, mysticism, PRAYER, faith healing, and alleged miracles, which heretofore had been considered beyond the range of naturalistic explanations.

PAUL KURTZ

SLENKER, ELIZABETH "ELMINA" DRAKE (1827–1908), American freethought writer and birth control advocate. Elizabeth "Elmina" Drake was born the oldest of six girls in LaGrange, New York. Her father had been expelled as a Shaker preacher for becoming a "Liberal." Elmina's skeptical awakening occurred when her mother offered her a dollar to read the Bible. "I became a sceptic, doubter, and unbeliever, long ere the 'Good Book' was ended," she wrote in *Studying the Bible* (1870). She married Isaac Slenker, who answered her ad for an egalitarian husband in the *Water-Cure Journal.* In the early 1880s they moved to Snowville, Virginia, where he operated woolen mills.

Slenker adopted Dianaism, a philosophy preaching sexual sublimation and other practices that offended the guardians of the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF) and helped avoid unwanted pregnancies. She advocated use of "contraceptics" in Moses HARMAN's *Lucifer, The Light Bearer.* When Slenker was arrested at age sixty in April 1887 for mailing private, sealed letters of advice on sex and marriage, it made national news. Bail was set at two thousand dollars. She was ushered into a cold cell and given a blanket to spread on the floor, she reported in *THE TRUTH SEEKER*, and was, she wrote, arrested simply "for speaking plain truths in plain words."

The *New York Times* and other press vilified Slenker for refusing to swear on a Bible, and for testifying that she did not believe in God, ghosts, heaven, hell, the Bible, or Christianity. Unable to raise bail, Slenker spent six months in jail awaiting trial. Readers of *The Truth Seeker* contributed to a defense fund, and freethinking attorney Edward W. Chamberlain represented her during the October 1887 trial before the United States District Court for the Western District of Virginia at Abington. Although a jury found her guilty, Slenker was set free by the judge on November 4, 1887, after Chamberlain argued that Slenker had not knowingly mailed obscene material.

Slenker wrote for nearly all the freethought journals, edited *Little Freethinker* (1892–98), and wrote novels including *The Clergyman's Victims*; *Mary Jones, the Infidel School-Teacher* (both 1885); and *The Darwins* (1879). Her 153-page book *Studying the Bible* was made up of columns originally published in the *BOSTON INVESTIGATOR.* Slenker died in Snowville, Virginia, in 1908.

ANNIE LAURIE GAYLOR

SMITH, CHARLES LEE (1887–1964), American atheist activist and editor. Born near Fort Smith, Arkansas, Charles Lee Smith considered a career in the ministry, clerked in a law office, and passed the Oklahoma bar. Around 1912 he discovered *The Jefferson Bible*, Thomas JEFFERSON's redaction of the New Testament stripped of its miracles (see MIRACLES, UNBELIEF IN). Thus led him to FREETHOUGHT literature and eventually ATHEISM. After World War I Smith moved to New York, where he sold and wrote for the nation's leading freethought paper, *THE TRUTH SEEKER*, then edited by George E. MACDONALD.

In 1925 Smith and associate Freeman Hopwood

founded the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM (the 4As), which won broad publicity for an ultimately barren scheme to organize student atheist groups. Among Smith's coups was a debate against the prominent evangelist Aimee Semple McPherson.

In 1928 Arkansas mulled an antievolution law (see EVOLUTION AND UNBELIEF). Smith's quixotic protests demonstrated his combative style. Attempting to lobby in Little Rock, he challenged legislators for singing a hymn; the lower house barred Smith from its chambers. He rented a storefront "atheistic headquarters" where he gave away evolution tracts and antireligious brochures. A window sign read, "Evolution is True. The Bible's a Lie. God's a Ghost." Smith was arrested, then barred from speaking at his arraignment because he was an atheist. Rejecting a fine, Smith demanded jail time and launched a hunger strike. National publicity painted Arkansas as an ignorant backwater; charges were dropped. Smith reopened his store and was again arrested, this time for BLASPHEMY. After a conviction, years of appeals followed before the case was dismissed. The antievolution law passed.

Hurt by the Depression, the 4As became a paper operation after 1933. In 1937 the aged George Macdonald transferred *The Truth Seeker* to Smith. Influenced by its associate editor Woolsey TELLER, by 1950 Smith openly reshaped the magazine as the organ of socially conservative freethought: anti-communist, eugenicist (see EUGENICS), anti-Semitic, and racist. Circulation plummeted.

In 1956 Smith published a comprehensive statement of his philosophy. Almost unreadable, the two-volume *Sensism* sold poorly. In 1961 he gave five thousand dollars to Madalyn Murray O'HAIR, then beginning her school prayer lawsuit against the Baltimore public schools; so toxic was Smith's reputation by then that the attorney preparing O'Hair's first petition dropped the case. In 1964 San Diego atheist James Hervey JOHNSON purchased what remained of the Truth Seeker organization and the vestigial 4As. Moving to San Diego, Smith edited *The Truth Seeker* for six months before dying of a heart attack on October 26. He was cremated.

TOM FLYNN

SMITH, KATIE KEHM (1868–1895), American FREETHOUGHT lecturer and organizer. Born in Warsaw, Illinois, Katie Kehm graduated from high school in Ottumwa, Iowa, and took up teaching as a profession. As early as seventeen, she began to speak publicly on freethought and soon became well known in freethought circles as an eloquent lecturer.

Freethought groups were being formed in Oregon during the 1880s with encouragement from visiting lecturers including Robert Green INGERSOLL, Samuel Porter PUTNAM, B. F. UNDERWOOD, Mattie KREKEL, and others. In 1889 a state convention was held to form the Oregon State Secular Union. When Katie Kehm spoke before the union the following year, she made such an impression that she was appointed secretary, a position she would hold until her death five years later.

In 1891 she married David W. Smith, a Port Townsend, Washington, judge who was also a freethinker. In 1893 she started the First Secular Church and Sunday School in Portland, and her regular Sunday lectures soon attracted a congregation of hundreds, certainly as large as any of the other orthodox churches in Portland. Due to her energetic organizing, many more secular schools were soon set up throughout the states of Oregon and Washington.

Using her training as a teacher, she wrote and circulated lessons and training manuals so that the schools could all follow the same curriculum, writing as a guideline that "[a] Secular Sunday school must be founded on knowledge, not theories; upon facts, not fictions; upon things known not believed; upon that which pertains to men, women and children, and not to gods, angels or devils; in short, all that pertains to this world and the here and now, and not to some other world 'in the sweet by and by.'"

Basic to her secular philosophy was encouraging people to celebrate natural events such as the Winter Solstice rather than religious holidays. Besides the programs for young children, she also wrote comparative religion lessons for adults, and shortly before she died was making plans to set up a Liberal University at Silverton, Oregon (see WAKEMAN, THADDEUS BURR).

After her untimely death from a fever at age twenty-seven, the network of secular Sunday schools continued for a time under the leadership of Nettie A. Olds.

ELIZABETH M. GERBER

SOCRATES (469–399 BCE), Greek philosopher. A leading Athenian philosopher, Socrates wrote nothing, preferring to engage in argumentative conversations with his fellow citizens. Of the main sources concerning Socrates, PLATO's dialogues are the most important. It is a contested matter just how much of Plato's Socrates is a record of the philosophy and method of a man with whom the young Plato was acquainted, and how much is due to the literary and philosophical genius of Plato, who created Socrates the philosopher in his dialogues.

Plato's early dialogue *Apologia* purports to be Socrates' defense at the trial at which he was condemned to death. Socrates says that his role as a gadfly stinging the rump of the Athenian state was his God-appointed duty. His role as critic had never been opposed by his *daimonion*, his personal divine sign or "voice which whenever I hear it always turns me back from something I was going to do, but never urges me to act." The *daimonion* never prohibited his philosophical activity. His extraordinary affect on his contemporaries culminated in his enemies bringing two charges against him. The first was that he had corrupted the young (a matter the court normally did not hear); the second was that he did not obey the city's official gods and created his own. Surprisingly Socrates does not address the second charge directly, arguing instead that he is not an atheist (see ATHEISM) and does believe that there are divinities. These matters suggest that there was an irrational side to Socrates, who believed that he had direct access to divine forces.

But there is also a relentlessly rational side to Socrates. He would not expect anyone to base their beliefs, including religious beliefs, on any authority but reason: "the unexamined life is not worth living." He speculates that one reason for his trial was because he thought of himself as a superior "know-it-all" tripping people up with his clever sophistries with which the weaker argument could always defeat the stronger. Once the Delphic Oracle was asked: "Is there any person wiser than Socrates?" The answer was "No." On Socrates' understanding of the answer, he was wiser than others in only one respect. They claimed to know answers to his questions, but Socrates could show, time and again, that they did not. But nor did Socrates know the answers. His only wisdom was in the fact that whereas others claim to know but did not, Socrates knew that he did not know.

What were the kinds of questions that Socrates asked? Often they were of the form: What is X? where X could be love, friendship, beauty, piety, temperance, courage, virtue, justice, knowledge, and the like. Standardly a Socratic dialogue begins with some person suggesting an answer to one of these questions. By critically examining this initial definition using the method of question and answer (*eristic*), Socrates was able to drive them into a contradiction. This is the Socratic *elenchus*, cross-examination leading to contradiction or refutation. To escape the contradiction a revised definition was proposed which overcame the difficulties raised. But once more, by applying his eristic technique of cross-examination, Socrates drove the person into contradiction. And the process was repeated until the person ran out of further ideas, and no other interlocutor had any further ideas. At this point all are in a state of *aporia*, that is, there is no way forward and the disputants are in a state of perplexity. Often Plato's "Socratic" dialogues end at this point.

In such encounters it is clear that Socrates has no final answer to the "What is X?" question. As he put it in the *Theaetetus*, he is merely the midwife assisting at the birth of an idea had by someone else. As midwife, it is not Socrates giving birth to ideas; his role is to assist and then examine the birthchild of others for its intellectual health. But Socrates at least knows something. Even if he does not know the answer to a substantive question, he does know how to subject people's beliefs to critical evaluation. A person subject to critique by Socrates may have two reactions to the state of *aporia* in which he leaves them. Either they are pleased with Socrates for subjecting their ideas to critical examination, so that they know that their former claims to knowledge were defective and they are open to improvement; or they are resentful for being tricked yet again by Socrates and are not able to defend themselves.

Socratic dialogues move at two levels. The first is to seek answers to the substantive questions posed. The second is more methodological or philosophical in that questions are raised about the following: What is an adequate definition? Can we ever know that we have arrived at the correct definition? Does the question-answer method enable one to arrive at correct answers (this being the aim of *dialectic* as opposed to *eristic*)? What are the correct arguments we ought to employ? These and other questions take us to the heart of philosophical method and lie at the core of the critical approach championed by Socrates, in which dogmatism is to be resisted and the examined life becomes a worthy life to lead, even if there are no definitive answers as to what is right but several as to what is wrong.

ROBERT NOLA

SOLARIN, TAI (1922–1994), Nigerian educator and prodemocracy activist. As a child Tai Solarin received his education in a Methodist missionary school in Nigeria. As an adult, he performed duty with the British Royal Air Force during World War II. He later studied at the University of London, and he was awarded a degree in history and geography from the University of Manchester.

In 1956 Solarin founded the Mayflower School, the first secular school in Nigeria. The school was unique in that it brought Christians and Muslims together without arguments or violence. Solarin placed strong emphases on self-reliance and critical thinking. He placed secular, human-centered messages on the buildings and in the classrooms throughout the campus. He often wore a white cap with bold yellow letters bearing the message "Knowledge Is Light" (a favorite saying of one of Solarin's heroes, Robert Green INGERSOLL).

Solarin believed that missionary schools could not be used effectively to educate African students. Furthermore, he challenged the notion that there were causal factors or a correlation between religious instruction and morality. Moreover, he believed that mission schools were basically tools to force Africans to carry out the will of the British government. He was especially critical of Roman Catholicism, believing that it was the religion most inimical to development of critical-thinking skills.

Solarin charged that the mission schools practically brainwashed Africans in denigrating efforts to "civilize" them by imposing Christianity. In this way, Africans were acquiring Western ways while learning to disrespect their own culture and customs.

Solarin was a fierce critic of government corruption and military leaders. In 1966 the civilian government of Nigeria attempted to have him assassinated. However, there was a military coup in the nation, and the assassination attempt was thwarted.

In 1976 Solarin gave the government control of Mayflower, even though he continued to lead the school. He wrote for many of Nigeria's leading newspapers, including the *Guardian*. He wrote several books, including his autobiography.

Solarin believed he was the only outspoken atheist in Nigeria—and he relished the role. He would courageously critique religion in the newspapers. He asserted that there is no evidence for the existence of God, and that if God exists, he owes the world an apology, especially the black race. He said that the world needs human leadership, and that all of the men supposedly sent by God had ultimately come up short. He contended that not prayer but hard work is chiefly to be valued, and he argued that Nigerian Christians and Muslims posed the greatest threat to the nation's security.

Solarin strongly criticized his country's military government and was often imprisoned for expressing his views. At the age of seventy-two, on the day before he died, Solarin participated in a march against the rule of Nigerian dictator Sani Abacha. Abacha's soldiers drove Solarin and his wife, Sheila, in separate vehicles to separate police stations. Crowds of people successfully clamored for their release, and Tai continued the march. He died the next morning.

The *New York Times* reported Solarin's death; humanist and Nobel laureate Wole Soyinka dedicated his book *The Open Sore of a Continent* to him. Before his death in 1994, Solarin served as a proud role model for the Nigerian group Action for Humanism and offered support to the Nigerian Humanist Movement.

In 2001 the Council for Secular Humanism and the Nigerian Humanist Movement held the first major international humanist conference in sub-Saharan Africa. Sheila Solarin, Tai's widow and the group's matriarch, read a paper, and students from the Mayflower choral group sang for those in attendance.

In June 2004 the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU) and the Nigerian Humanist Movement hosted the Tai Solarin International Humanist Conference at the Mayflower School. Participants from Africa, Europe, and the United States were in attendance.

Solarin's legacy lives on in numerous books, papers, newsletters, and on numerous Web sites. But most importantly, Mayflower (now a junior and senior high school) continues to turn out some of Nigeria's best and brightest students.

NORM R. ALLEN JR.

SOLOMON, ABRAHAM (1914–2004), Indian humanist activist. Awarded the Distinguished Service Award by the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU) in 1999, Abe Solomon initiated the formulation of the Universal Declaration of Human Values in 1988.

Solomon was born into Bombay's (now Mumbai) small Bene Israel community, a Jewish enclave whose members were descended from Galilean Jews shipwrecked on the Indian subcontinent circa 150 BCE. Brought up by his uncle, Solomon developed as a rationalist (see RATIONALISM). Solomon edited *Reason*, a Mumbai-based rationalist journal, starting in the early 1930s.

In 1933 Solomon was subjected to India's first BLASPHEMY prosecution. The case attracted wide notice and helped to establish Solomon's stature in India's rationalist movement. In 1934 he founded the rationalist Youth League in Mumbai. He and Nissim Ezekiel, also of the Bene Israel community, worked together in radical humanist student associations and movements. Solomon converted Nissim Ezekiel to ATHEISM, rationalism, and humanism. Ezekiel would gain fame as India's foremost English-language poet.

Solomon worked with various humanist and secularist associations in India, and collaborated with rationalist stalwarts like R. D. Karve, R. P. Paranjape, Erulkar, George Coheo, and Lotwala Ranchhoddas in India. He established Modern Age Publications, which brought out rationalist literature and published the English version of the influential *Critique of Hinduism and Other Religions* by Laxman Sastri Joshi. Joshi was a Marathi scholar and former adviser to Mohandas K. Gandhi who later came close to M. N. ROY. Modern Age also published Roy`s controversial 1945 booklet on Nehru.

Solomon joined the International Confederation of Free Trade Unions, a worldwide association of labor unions. In 1936 he moved to Brussels, Belgium, where he resided until 1978. He was a board member of the IHEU from 1971 to 1978. During this time he represented the interests of Indian humanists within the IHEU. Solomon was active in the Indian Secular Society (see INDIA, UNBELIEF IN) as its vice president and, later, its president (following the death of founder A. B. Shah), and edited the society's journal, the *Secularist*. For a short period he also worked for the magazine *Quest*, based in Kolkatta. As a radical humanist, he collaborated with humanist leaders like Shib Narayan Ray, V. M. Tarkunde, Indumati PARIKH, R. A. Jahgirdar, Indian Humanist Association leader Prakash Narain, and G. R. R. Babu, who became executive director of the IHEU. Solomon's eleven articles were published in the US journals *Free Inquiry* and the *Humanist*, and in the Indian journal *Radical Humanist*. In these writings he traced the source of values in the dignity of human person, moving on to discuss such qualities as reason, critical intelligence, truth, tolerance, creativity, freedom, equality, justice, man and nature, and universal culture—a future culture rooted in freedom, truth, reason, and compassion that he spent his long life striving to help bring closer to reality.

INNAIAH NARISETTI

SOPHISM. A movement of itinerant philosophers that thrived in fifth-century BCE Greece, especially in Athens; members of Sophism were the first professional teachers. The Sophists were important figures in the history of FREETHOUGHT and unbelief. They were among the first to question the existence of supernatural beings, and to raise the question as to whether morality comes from the gods or is instead a human construct. Unfortunately, most of what is known about them is contained in the writings of the philosopher PLATO, who was decidedly opposed to them, particularly for their eschewal of metaphysical speculation.

The word *sophist* itself comes from the Greek *sophia*, and essentially means "the wise men." The Sophists claimed not only to possess wisdom, but to be able to impart it to others, for a fee. This is why they are called the first professional teachers. They taught the art of successful living (the word *sophisticated* describes the type of existence they advocated). It was important, they claimed, to dress well, speak persuasively on all matters, know the most up-to-date information on current affairs, and generally impress one's friends and neighbors. All of this, the Sophists held, could be learned and mastered. However, metaphysics—the search for ultimate knowledge—was, they argued, a futile pursuit. No human beings truly knew the answers to such questions as whether there is life after death, whether the gods exist and, if so, what their natures might be, and whether human beings possess an immortal soul. Such topics could be argued over endlessly but ultimately had no resolution. Therefore, for the Sophists, such speculation was off-limits.

The best-known Sophist was PROTAGORAS (for whom Plato dedicated a dialogue). He thrived in the city of Athens, where he helped to prepare many of the young men there for careers in politics (Athens being unique for having a democratic form of government, where leaders were elected and thus had to appeal to the populace for support). Like all the other Sophists in Athens, he was not a native, and could not vote himself, but he was a strong proponent of democracy, arguing that it was a form of government that had the blessings of Zeus himself. SOCRATES, or at least Socrates' chronicler Plato, was to call him to task for such an assertion, since first of all Protagoras did not apparently believe in the existence of Zeus, and could not therefore base his defense of democracy on supernatural support, and second, since he was what today we would call a cultural relativist, he could not claim that democracy per se was the best form of government, but only that it was the form that worked best in Athens. Protagoras would have replied that as a

Sophist, all he need do was teach his pupils to appeal to the beliefs that the Athenians themselves held in order to prepare them for successful careers. It was not necessary to further pursue the actual underpinnings of metaphysical beliefs, since this was immaterial to winning popular support, and indeed would be likely to infuriate the populace, who would not appreciate having their religious beliefs so questioned. This insouciant attitude toward the divine not only troubled Plato, it led to Protagoras's own banishment from Athens on the charge of impiety (the same charge for which Socrates himself would later be found guilty and executed).

The word *sophist* has come to be a derogatory term, implying one who gives facile answers, and is concerned only with surface meanings. But this is unfair to the Sophist movement, which thrived for several centuries and which has strong connections with later philosophical movements such as PRAGMATISM, relativism, and postmodernism. It is perhaps unfortunate that so much of what is known about influential Sophists such as Protagoras, Thrasymachus, Lysias, and Gorgias is found primarily in the unsympathetic writings of Plato. As James Arieti puts it, learning about the Sophists from Plato "would be like learning about Franklin Roosevelt from what Barry Goldwater wrote or about Ronald Reagan from what George McGovern wrote." It is important to note that the Sophists were considered influential public figures of their day (perhaps the first "celebrities"), and their development of the art of rhetoric made major contributions to this field. Some consider them to be the first professional attorneys as well (which might not be a mark in their favor!), as they also coached their students in the skills of presenting a good case in the courts of ancient Greece. Plato was critical of them for charging a fee for their services, but surely most professional philosophers today cannot look down upon them for that. In their own defense the Sophists would have asserted that they worked hard to develop their talents, through years of study and through traveling much of the known world to learn about different customs and beliefs. Their training was based upon rigorous methodology, time-tested and constantly evaluated. Why should they not receive proper compensation for imparting such knowledge to others?

The Sophists played a major role in delineating one of the most argued-about topics which still concerns us, namely, the "nature/nurture" debate. As Protagoras famously declared, "Man is the measure of all things." This sentence has been much debated, but the most accepted understanding is that all knowledge is determined by human standards. There is no "God's-eye view" allowing us to transcend our earthly existence and see the "big picture" in its entirety. While this may be called a relativistic viewpoint, the Sophists would ask what alternatives there are. In addition, the Sophists did claim that, while most human customs are peculiar to specific times and places, there are some constants that transcend these, such as human biology. Antiphon, for instance, argued that Greeks and so-called barbarians (i.e., non-Greeks) have the same natural needs, breathe the same air, and eat with their hands in the same way. Thus, a code of ethics based upon common traits was certainly a possibility, but in point of fact most ethical systems were grounded upon cultural conventions, regardless of how universal their adherents might claim them to be. Since the Sophists actually traveled throughout the ancient world, as opposed to most people of the time who seldom left their native cities (including Socrates himself), they could claim to speak from experience.

For freethinkers, the Sophists are controversial ancestors, though clearly pioneers in bracketing metaphysical concerns and focusing on what could be reasonably achieved in the here and now. As Protagoras so eloquently put it: "As to the gods, I have no means of knowing either that they exist or that they do not exist. For many are the obstacles that impede knowledge, both the obscurity of the question and the shortness of human life." Most contemporary unbelievers would concur with these wise words.

TIMOTHY J. MADIGAN

SOUTH PLACE ETHICAL SOCIETY. The London-based South Place Ethical Society has, over more than two hundred years, moved from Universalism and Unitarianism to rational religion and then ethical thought.

In 1793 a group of dissident nonconformists in Bishopsgate, London, at Parliament Court, were taken over by the American preacher Elhanan Winchester. Winchester and his congregation were Universalists; they believed there would be universal mercy and no descent to hell (see UNIVERSALISM TO 1961). He continued his ministry for eighteen months before returning to America. He was succeeded by the Sussex preacher William Vidler, who became convinced of the Unitarian belief that God was one entity and the Trinity was a fiction (see UNITARIANISM TO 1961). Vidler stopped preaching in 1814 because of illness and disability.

William James Fox. After a leadership gap, William James Fox became the group's most important leader

during the first half of the nineteenth century. Born in Suffolk in 1786, he mixed with radical weavers. He began his ministry in Fareham, in Hampshire. He became an effective Unitarian preacher and in due course succeeded to the vacancy at the South Place Chapel in Parliament Court.

The chapel flourished under Fox. He was a brilliant speaker, writer, and pastor. His radical views were seen in his support for Richard CARLILE, who had been imprisoned for republishing Thomas PAINE's *The Age of Reason*. Fox spoke out for the rights of Catholics and Jews, who lacked legal parity. He was active in the Unitarian Association and edited its journal, the *Monthly Repository*.

He attracted an educated and well-to-do congregation. He met the young Harriet MARTINEAU and encouraged her writing. The young Robert Browning attended and was published by Fox. The chapel became known as a center of progressive religion and radical politics.

After he separated from his wife, his secretary and a prominent member of the chapel, Elizabeth Flowers, moved in to his house to assist him. This caused controversy. Fox slowly moved away from the chapel. He was very active in the campaign to repeal the Corn Laws. He became a Liberal MP for Oldham from 1847 to 1862. As he relinquished the South Place Chapel he became a leading figure in public life.

Moncure Conway. Three succeeding preachers—Philip Harwood, Henry Jerson, and H. H. Barnett—were found unsuitable and the society faced closure. However, the society was to survive and to flourish again under Moncure CONWAY.

Conway was an American from the South who moved from Methodism to Unitarianism and was influenced by Ralph Waldo EMERSON. He was forcefully antislavery and visited England in 1863 to speak on the antislavery platform. After an engagement at South Place, he was offered a six-month trial period that left the congregation in no doubt about accepting him as a permanent leader, after which the declining congregation revived and its financial position improved.

Conway brought changes; for instance, he declined to wear the black silk gown that had been Fox's uniform. He introduced alternative readings—in particular from Eastern religions. Prayers gave way to meditative readings. Ethical ideals were replacing theistic ones. He became friends with many of London's intellectual leaders, scientists and poets alike. He decided to leave and departed for America in 1884.

Conway suggested a pupil of the American Felix ADLER, founder of ETHICAL CULTURE, as a successor. But Stanton Coit was not, in the long run, a success. He introduced the word *ethical* into the society's title but was too domineering for the congregation's taste. He left to found the Ethical Church in Bayswater.

Conway returned from 1892 to 1897, after which he finally departed for good. His great task in his later years was to research and write the first full and unbiased life of Thomas PAINE.

After Conway's departure no single leader was found and a system was established under which several "appointed lecturers" took over the platform. Five people who took this role very successfully were: J. M. ROBERTSON, the freethinking scholar and Liberal politician; Herbert Burrows, a genial socialist and Theosophist; J. A. Hobson, a distinguished economist and historian indicting the empire; Cecil Delisle Burns, an ex-Catholic who lectured at the London School of Economics; and Joseph MCCABE, who trained as a priest and spent the rest of his life debating as a rationalist (see RATIONALISM).

The chapel was becoming old and difficult to maintain, so a move was agreed upon in 1913. World War I intervened, but land in London's Red Lion Square was bought in 1922, the foundation stone laid in 1927, and the building opened in 1929.

The society has remained to this day as an organization with Sunday morning meetings of lectures and discussions, with further talk in the afternoon. The musical concerts on Sunday evening have remained very successful. The building is of great value to London's myriad organizations looking for meeting rooms to debate and discuss the meaning of life: perhaps it is in this way that the spirit of Fox and Conway best lives on, as well as the continuing Sunday meetings of the South Place Ethical Society.

JIM HERRICK

SOUTHWELL, CHARLES (1814–1860), English freethought activist. Charles Southwell was born in London into a large, poverty-stricken family. His unruliness led to his departure from education at the age of twelve. A colleague persuaded him to read Timothy Dwight's sermons, which began to develop his countertheological tendencies.

He became an ultraradical bookseller in Westminster. Joining a lecture group, he discovered his powerful oratorical abilities. He spent a period fighting for the Spanish Legion as a mercenary.

On his return he joined the Owenite movement (see OWEN, ROBERT) as a socialist missionary (see SOCIALISM AND UNBELIEF). His dramatic powers led to his popularity as a speaker, but in due course he fell out with

Owen, not sharing the latter's Utopian ideals. Southwell preferred lectures and education as a means of change rather than the direct action favored by Owen. He was sent as a "missionary" to Bristol, where he resigned from Owen's network and started a paper with William Chilton in 1841: the *Oracle of Reason*, the first openly atheist journal in Britain (see ATHEISM).

In the fourth issue, an article on the Bible was titled "The Jew Book"; it contained the words "This revoltingly odious Jew production. . . . It is a history of lust, sodomies, wholesale slaughtering and horrible depravity." Southwell was arrested for blasphemous libel (see BLASPHEMY) and was sentenced to prison for one year and given a fine of one hundred pounds. After leaving prison he founded the *Investigator*, which lasted seven months. Moving north to reopen the Manchester Hall of Science in 1849, he established the *Lancashire Beacon*, which sold well, but lost money and closed in 1850.

In 1855 Southwell left for Australia—ever a fortune hunter. He sought election to the Victoria Legislature, but his chances were ruined when it became known that he was an atheist who had been imprisoned for blasphemy. He joined a troupe of Shakespearean actors who traveled to New Zealand. There, he started the *Auckland Examiner*, which concentrated on corruption, until he was forced to close it after three years because of ill health. He died in New Zealand, probably of tuberculosis, in 1860.

SPAIN, UNBELIEF IN. Since the fifteenth century, Spain has maintained religious uniformity by eliminating dissidents. This accounts for the absence of visible unbelievers until recent times. Earlier, between the eighth and fifteenth centuries, the Iberian Peninsula had been inhabited by Christianized Visigoths, Arabian Muslims, and exiled Jews. In order to preserve Catholic unity, during the late fifteenth and early sixteenth centuries the Spanish kings expelled all non-Christians. The honesty of those who converted to avoid exile was closely scrutinized. The Inquisition was created to suppress religious and political dissent; it prosecuted unbelievers as unpatriotic. Not surprisingly, anticlericalism (if not unbelief) spread widely. As Nobel laureate C. J. Cela commented, "Spaniards always follow priests, some to support them, some others to beat them." Yet only in the second half of the twentieth century has Spain enjoyed sufficient freedom for nontheistic ideas to be aired widely in public discourse.

Medieval and Modern Periods. Spanish Muslims developed a refined civilization at Córdoba marked by high achievements in science, literature, and philosophy. Learning flourished also at the School of Translators in Toledo, where scholars from Spain's three cultures strove together helping to preserve ancient works. The "enlightened" society that prevailed there paved the way for an incipient unbelief. In his famed *Dictionary*, Pierre BAYLE quoted the Spanish writer Alonso de Madrigal's claim that learned Muslims faked their obedience to the Qur'an, inwardly rejecting many of its teachings as opposed to reason. In his *Critical History of Religious Ideas* (ca. 1028), Ibn H'azm offered refutations of those who denied the immortality of human soul or espoused a materialist philosophy. The identities of these skeptics are unknown, but they undoubtedly existed or Ibn H'azm would not have tried to refute them. Heterodoxies were reinforced by the philosopher of Córdoba, AVERRÖES, and his theory of double truth, which posited a split between the truth of reason and the truth of faith.

Confronted by Protestantism, Catholic Spain gave birth to *la Contrarreforma* (the Counter-Reformation). Erasmists (see ERASMUS, DESIDERIUS) and Protestants emigrated in haste. Miguel Servet was one of those obliged to run away. He moved to Switzerland, where, as Michael Servetus, he was burned alive by John Calvin at Champel, Switzerland, in 1553. Arias Montano was a biblical scholar who authored the Trilingual Bible of Antwerp and urged Christians to follow the Bible instead of church dogma. He much preferred research into the Hebrew language and biblical studies to the vacuous scholastic disputations then in vogue. In time he was banned from teaching; some of his disciples suffered more severe penalties.

In Spain there has been a long tradition of physician-philosophers, naturalists inspired by the atomism of Democritus, the Stoicism of LUCRETIUS, and the ideas of the later rationalists Pierre Gassendi and René DESCARTES. One of them was Juan de Prado, a *judaizante*, a Jew the sincerity of whose conversion to Christianity came into question. Going into exile in Amsterdam, Prado would exert a strong influence on the thought of Baruch SPINOZA.

By the late 1500s the mass expulsion, conversion, or execution of Muslims and Jews was largely complete, and the Inquisition turned to attack unbelief. Even the mention of unbelief in published works was forbidden. Gerónimo Gracián wrote *Diez lamentaciones del miserable estado de los ateístas en nuestro tiempos* (Ten Laments on the Miserable Status of Contemporary Atheists) but could not publish it in Spain; it was published in Brussels in 1611. In 1654 Francisco de Vega Vinero was probably the first Spaniard to be executed for the crime of ATHEISM.

Enlightenment ideas did make some headway in Spanish society, but they were expressed only in calls for incremental social and clerical reforms. No home-dwelling Spaniard dared challenge theism itself. In one sense this benefited the Spanish society of this period, as people holding Enlightenment ideals could attain high positions in politics or the clergy. On the other hand, only Spaniards living abroad could follow Enlightenment thinking to what was often its logical conclusion: unbelief.

Notable Spanish expatriate unbelievers of this period included the abbot José Marchena, whose sympathy with the French Revolution was so extreme that he traveled to Paris to join it; in his articles, essays, and translations he espoused open atheism as well as revolutionary politics. The priest José María White, of Irish descent and known as Blanco White (*blanco* being Spanish for "white"), fled to England, where he joined the Anglican Church. He read Francis Bacon, the iconoclastic Spanish monk Benito Feijóo (see SPANISH LITERATURE, UNBELIEF IN), Baron d'HOLBACH, and others, eventually becoming a skeptic and finally an atheist. Juan Antonio Llorente was a priest who joined Napoleon's army and settled in France, where he wrote a bitterly critical history of the Inquisition.

Nineteenth Century. After the turn of the nineteenth century, religious and political resistance to Enlightenment influences of every type became more pronounced. The aristocracy feared revolutionary uprisings, while citizens rebelled against Napoleon's invasion. Intellectuals who embraced the new values were disparaged as unpatriotic and labeled *afrancesados* ("Frenchified"). Unstable governments oscillated between clericalism and anticlericalism. Frequent revolts and riots attacked the priesthood as an author of miseries. No fewer than three civil wars erupted between liberals and conservatives. To weaken church power, liberals pushed reforms such as the expropriation of church-owned lands, the dissolution or expulsion of religious orders, and governmental rather than ecclesiastical control of education. In 1840 the cabinet of regent Joaquín Baldomero Fernández Espartero attempted to appoint Spain's bishops; as late as 1955, the regime broke diplomatic relations with Rome. The most radical project to separate church from state was the 1868 revolution and the short-lived First Republic, headed by secularists including Francisco Pi y Margall and Nicholás Salmerón.

On the intellectual front, unorthodox thought could be expressed again after the Inquisition was suppressed in 1834. Around 1860, Julián Sanz del Río launched a lively movement based on the rationalistic and humanist philosophy of Karl Krause (see PANTHEISM AND UNBELIEF). The *krausismo* movement advocated for laicism or secularism, and proposed a spirituality variously described as panentheist and AGNOSTIC. Its influence lasted into the twentieth century. In 1887 R. H. Ibarreta wrote *La Religión al alcance de todos* (Religion Explained to Everyone), the first best seller promoting unbelief. In it, he explained in popular language the errors, lies, and wrongdoings of religions and the churches.

Twentieth Century. Although most leading unbelievers did not formally ally themselves with any particular organized ideology, anarchism and MARXISM were widely held among twentieth-century unbelievers. The anarchist leader Francisco FERRER Guardia founded La escuela moderna (The Modern School) in Barcelona, where he pioneered secularizing educational reforms and pedagogic advancements. Ferrer was infamously executed in 1909 as part of a repression directed at violent anarchist mobs that had burned churches and killed priests.

During the Second Republic, President Manuel Azaña enacted varied reforms, secularizing education, declaring religious freedom, and instituting civil marriage and divorce. Controversially he declared that "Spain is no longer Catholic." Krausist ideals inspired the *Residencia de Estudiantes* (Students' Residence), which aimed to boost foreign exchanges of both students and professors from 1910 to the start of the Civil War in 1936. During those years it housed such outstanding artists and world-renowned figures as Federico García Lorca, Salvador Dalí, Luis Buñuel, and others. Twentieth-century Spain produced a number of outstanding unbelievers, especially among scientists, philosophers, critics of religions, and filmmakers.

Two Spanish scientists who have received the Nobel Prize defended a rational outlook. Santiago Ramón y Cajal espoused a philosophy of materialistic reductionism (see MATERIALISM, PHILOSOPHICAL); based on his neurological discoveries, he rejected any idea of the soul. He called for tantalizing ancient creeds to be overcome as a precondition for genuine social improvement. Severo Ochoa, a national celebrity after receiving one-half of 1959's Nobel Prize in Medicine, wrote only on scientific matters, but made public his denial of a spiritualist outlook upon the death of his wife in 1986. In spite of deeply felt abandonment and loneliness, he firmly rejected the consolation offered by belief in an afterlife.

Miguel de Unamuno was a forerunner of European EXISTENTIALISM. He wrote novels, poetry, drama, and philosophical essays. His thought is an agonized reflection upon the conflict between the impossibility of finding a rational proof of faith, and the impossibility of renouncing his longing for immortality. Enrique Tierno Galván, professor of law, politician, and first democratically elected mayor of Madrid, wrote a 1975 pocket book, *¿Qué es ser agnóstico?* (What Does It Mean to Be an Agnostic?). Gustavo Bueno merges radical anticlericalism with a completely systematized materialist philosophy that covers every field, from an original theory of science to an anthropological explanation of religion's origins, which he traces to the animal totems of ancient tribal societies. Bueno is arguably Spain's most profound twentieth-century philosopher. Fernando Savater

has written drama, novels, essays, and newspaper articles. He explains ethics as a commitment of self-love that focuses not upon how to use one's body, but how to use one's mind. He portrays this commitment as a heroic task, using Friedrich NIETZSCHE's meaning. Savater is also a committed thinker who came out as an early opponent of Franco's dictatorship and remains active on the antiterrorist barricades today.

Diplomat Gonzalo Puente Ojea has written highly scholarly books focused on atheism, biblical criticism, Christianity as ideology, and the history of the Catholic Church. His thought draws on G. W. F. HEGEL's theory of alienation and Karl MARX's materialistic theory of consciousness, mixed with his own vast erudition. His works address a learned readership, and he is undoubtedly the leading contemporary champion of laicism in Spain. Less specialized books have been published by the ex-Jesuit Salvador Freixedo, the journalist Pepe Rodríguez, the physicist López Campillo, and others.

Luis Buñuel directed innovative surrealist films, realistic social commentaries, and satiric critiques on bourgeois manners. He received a US Academy Award in 1972. He was a lifelong iconoclast, freethinker, and a satiric exemplar of individualist anarchism. In his autobiography he portrayed himself as a proud unbeliever. Other Oscar-winning Spanish directors who are open unbelievers are Pedro Almodóvar and Fernando Trueba. Trueba directs comedies; accepting his 1994 Academy Award for his film *La Belle Epoque*, he said, "I cannot thank God because I do not believe in him, therefore I thank Billy Wilder."

Since the early 1960s, when the Second Vatican Council affirmed for the first time in Catholic history the right of every person to his or her own religion, Spanish life has been marked by a degree of religious freedom not seen since the fifteenth century. Non-Catholic denominations are permitted, and unbelievers can express themselves relatively freely. Freedom of religion was further strengthened in the 1978 Constitution. Nevertheless, the Roman Catholic Church retains a legally privileged position, receiving financial support from the state and holding a de facto monopoly on religious teaching. Many Spaniards, including most unbelievers, oppose the church's prerogatives. Spain's two main political parties hold conflicting positions on church prerogatives, but fortunately both sides contend nowadays in a nonviolent manner.

JESÚS PUERTAS

SPANISH LITERATURE, UNBELIEF IN. Aside from short lapses during the nineteenth and twentieth centuries, unbelieving writers have not enjoyed freedom of expression until 1978, when the constitution now in force was passed. Prior to 1978 Spanish society still bore the imprint of the Catholic Inquisition and the reactions it had engendered. Established in 1480, the Inquisition was intended not to save heretic souls, but to maintain orthodoxy by frightening the people, as stated in the *Manual del Inquisidor* (Manual for the Inquisitor). The manual also stated that any means is allowable to achieve this goal, including secrecy, lies, threats, or blackmail. Under such oppressive conditions, most critical authors did not espouse ATHEISM or AGNOSTICISM, strictly defined; instead they focused upon demolishing the political, economical, and social power of the church. This attitude gave birth to a prevailing trait of Spanish character known as anticlericalism. Anticlericalism rejects clerical power while it denounces church crimes and immoralities. When it does not deny God's existence, it portrays Catholicism as but one of many possible ways to interrelate with God.

Before the Eighteenth Century. The first writers in the Spanish language expressed some anticlerical criticisms directly, and others through satire. *El Libro de Buen Amor* (The Book of Good Love) was written in jail by the poet and archpriest of Hita, Juan Ruiz, about 1335. Written in rhymed quatrains, the book justifies its sensuous and sinful content as a mode of instructing the reader about the love of God. To do this, he portrays himself in dialogue with Love personified, giving examples of the evil loves that must be avoided and telling humorous and irreverent stories of clerical misbehavior and abuse.

In 1499 Fernando de ROJAS wrote *La Celestina*, a novel in dialogue that treats human passions and ignores godly matters, which was most uncommon at that time. *La Celestina* tells the crude story of Calisto, who requests the aid of Celestina, a retired whore who makes her living by pimping. The old woman casts spells for Calisto so that he can win the love of Melibea. In one scene Calisto is questioned whether he believes in God; his answer is: "I am Melibean, I believe in Melibea." The novel ends tragically, as a warning to readers that they will face God's punishment should they persist in sin. This moral excuses the salacious content of the novel.

Protestant ideas first entered Spain with the works of Desiderius ERASMUS. At first the Erasmian preference for

inner religious consciousness over public rituals was welcomed, even by the inquisitor general and the king. Before long, however, the church understood that allowing an unmediated relation with God would imply the end of the Catholic authority. The *erasmistas* were always under scrutiny and some were penalized; this happened to the author of the first Spanish grammar, Antonio de Nebrija. Concerned at the spread of what it considered dangerous novelties, the Inquisition intensified its scrutiny of unorthodox ideas, to the point that it proscribed the books of, and sometimes jailed, clerics who would later become towering figures in Catholic mysticism, including Saint Teresa of Avila, Saint John of the Cross, and Fray Luis de León.

The sixteenth and seventeenth centuries saw the golden age of Spanish literature. Most important writers were clerics, but anticlerical features can nonetheless be discerned in some works, for instance, in the anonymous novel *El Lazarillo de Tormes* (Lazarillo: Blind Man's Guide), or in Francisco de Quevedo's masterpiece *El Buscón*. These picaresque novels depict low-born characters who disregard any moral constraint as they struggle to survive in a poor, uneducated, and superstitious society. Picaresque style generally satirizes clerics as the abusive social class responsible for most of the people's misery. The popularity of the picaresque reflects a widespread pessimism; this may seem paradoxical, given that Spain was the most powerful country of that time, but it reflects the ineluctable decadence of a theocracy ruled by idle classes.

From the Enlightenment to the Present Day. Although the rationalistic outlook is present in some progressive writers, the Inquisition was still doing its best to lessen philosophical influences, but it couldn't avoid them entirely. Between 1726 and 1739 the monk Benito Feijóo published *Teatro Crítico Universal* (Universal Theater of Criticism), an encyclopedia of critical essays on numerous issues. Jovellanos, a statesman, focused on achieving economic and cultural progress through agrarian reform and educational development; his writings helped to instill doubt in Spain's theocratic system. Leandro Fernández de Moratín stood out in the realm of drama and comedy, satirizing the uses and moral values of higher classes. Félix de Samaniego and Tomás de Iriarte wrote irreverent and lubricious fables for which they were imprisoned by the Inquisition. José Cadalso, in his 1793 *Cartas Marruecas* (Letters from Morocco), used the epistolary style to debunk various superstitions. Mariano de Larra wrote critical articles and a literature of manners; in his poems, José de Espronceda depicted deeply romantic characters whose unfulfilled wishes lead them to blame God for their unhappiness.

Nineteenth-century Spain was riven by continual fights between conservatives and liberals; politics was unstable throughout this century which saw many constitutions, tens of governments, and three civil wars. The Inquisition disappeared, allowing unbelief to begin to flourish anew. Clarín, pen name of Leopoldo Alas, absorbed Krausist ideals (see SPAIN, UNBELIEF IN) and crusaded against the usurpation of power by the church. In 1884–85 he published *La Regenta* (The Regent's Wife), a masterpiece of world literature about an ambitious priest whose main goal is to increase his social influence as confessor of *La Regenta* (the wife of the local authority). Then he falls in love with her, which leads him to become to some extent both skeptical and hypocritical. Benito Pérez Galdós was an excellent and popular realistic writer. Through his novels he exposed how divisive and damaging religious dogmatism could become. Blasco Ibáñez criticized the power of Jesuits on the rich penitents and Pérez de Ayala in AMDG (for *Ad Majorem Dei Gloriam*, motto of the Society of Jesus) described the stifling education in Jesuit boarding schools. The loss of Spain's last colonies in 1898 convulsed the nation and inspired the Silver Age of Spanish literature. The Basque Pío Baroja was an individualist thinker whose confessed agnosticism pervades his novels and articles. The world-renowned Miguel de Unamuno adopted from Søren Kierkegaard the concept of anguish to express his recurrent oscillations between rational thinking and his emotional needs for immortality and justice. The novel *San Manuel Bueno, mártir* (Saint Manuel Bueno: Martyr) tells the story of a parish priest who is secretly agnostic but decides to stay in office pretending to believe, and acts so as not to disappoint his parishioners' longing for an afterlife. All his life long he keeps his agony hidden out of such altruistic devotion that people would later honor him as a saint and miracle man.

In the first half of the twentieth century, polarization between believers and unbelievers was one of the causes of the civil war. During Franciso Franco's regime, his policy of *nacionalcatolicismo* (national Catholicism) permeated public and private life, burdening Spaniards with yet heavier loads of sin and guilt. Yet at the same time, economic and educational improvements and the influence of millions of tourists from elsewhere in Europe led Spanish society in a more secular direction.

Today there are many unbelieving writers, although many act from motives that are more political than philosophical or anticlerical. The communist poet Rafael Alberti rejected the anti-Marxism of the church. Ramón J. Sender expatriated to the United States, where he taught and published his novels. Anarchist professor Agustín García Calvo opposed every form of social hierarchy, that of the clerics included. Antonio Buero Vallejo wrote dramas that displayed a crude and pessimistic social reality and debunked superstitions. Others, like Luis Martín Santos, Gabriel Celaya, Fernando Savater, Antonio Muñoz Molina, Luis Antonio de Villena, Lucía Etxeberria, Terenci Moix, and Antonio Gala, are only a few of the many writers who adopt an irreligious life stance.

JESÚS PUERTAS

SPENCER, HERBERT (1820–1903), English sociologist, evolutionary theorist, and philosopher. Herbert Spencer was born in Derby, England, on April 27, 1820. Spencer's family were Methodist "Dissenters" with Quaker sympathies. From an early age, young Herbert was strongly influenced by the antiestablishment and anticlerical views of his father, a schoolteacher, as well as the Benthamite radical views of his uncle Thomas (see ANTICLERICALISM; BENTHAM, JEREMY). His early education was largely informal, though he eventually trained as a civil engineer for railways. He soon turned to political journalism and worked for the *Economist* financial weekly, where he came into contact with such controversialists as Thomas Carlyle, George Eliot (Marian EVANS)—with whom he had had a lengthy (though purely intellectual) association—and Thomas Henry HUXLEY. Despite the diversity of opinions to which he was exposed, Spencer's confidence in his own views was coupled with a stubbornness and a refusal to read authors with whom he disagreed.

Spencer's early writings reveal a sympathy with many of the causes of the "philosophic radicals" such as Jeremy Bentham. Some of his ideas (e.g., the definition of "good" and "bad" in terms of their pleasurable or painful consequences) show similarities to utilitarianism, and he held radical views on land nationalization, laissez-faire economics, and the role of women in society—though he came to abandon most of these stands later in life.

Spencer's first book, *Social Statics, or the Conditions Essential to Human Happiness*, appeared in 1851. Influenced by the POSITIVISM and empiricism of Auguste COMTE—the term *social statics* itself was borrowed from Comte—Spencer focused on the conditions of social order, preliminary to a study of human progress and evolution (i.e., "social dynamics"). Here, one finds an account of the development of freedom and a defense of individual liberties, based on a (Lamarckian-style) evolutionary theory. His principal targets were Bentham and John Stuart MILL.

Following the death of his uncle Thomas in 1853, Spencer received an inheritance that allowed him to devote himself to writing. In 1855 *The Principles of Psychology* was published. Again, Bentham and Mill were major targets, and Mill later came to accept some of Spencer's arguments. *The Principles of Psychology* was much less successful than *Social Statics*, however, and about this time Spencer began to experience serious (predominantly mental) health problems that affected him for the rest of his life.

Despite his ill health and his inability to write for more than a few hours each day, Spencer embarked upon the nine-volume *A System of Synthetic Philosophy* (1862–93), which sought to provide a systematic account of biology, sociology, ethics, and politics. This "synthetic philosophy" brought together data from the various natural and social sciences and organized them according to evolutionary theory.

In the first volume of the *System*, *First Principles* (1862), Spencer outlines his argument that all phenomena can be explained in terms of a process of material evolution (see EVOLUTION AND UNBELIEF). Specifically, Spencer held that homogeneous organisms are unstable, that organisms develop from simple to more complex forms, and that evolution constitutes a norm of progress. Spencer referred to this process as "survival of the fittest"—an expression that his contemporary, Charles DARWIN, later employed. Although critics have pointed out that this notion is both ambiguous—for it was not clear whether one was referring to the "fittest" individual or species—and far from universal, it provided a concise statement for the kind of process described by Darwin. Moreover, while Spencer's evolutionary theory was distinct from Darwin's, Darwin's respect for Spencer was significant.

In *Principles of Biology* (1864–67), Spencer argued that there is a gradual specialization in things toward self-sufficiency and individuation. The "tendency to individuation" was coupled with a natural inclination to self-preservation; in human beings, this was reflected in rational self-interest. Spencer also insisted that, over time, human nature has improved and changed, and so scientific—including moral and political—views that rested on the assumption of a stable human nature (presupposed by many utilitarians) were rejected. Nevertheless, Spencer recognized that individuals needed to be understood in terms of the "whole" of which they were "parts," and held an "organic" view of society. But he saw no inconsistency in holding both individualism and organicism, for individuals were mutually dependent, not subordinate to the organism as a whole.

Starting with the characteristics of individual human beings, Spencer believed that one could deduce, using the laws of nature, the character of social life. For example, since they reflect the same evolutionary principles as biological organisms do, society—and even social institutions such as the economy—can function without

external control, just as the digestive system of a lower organism does. (In claiming this, Spencer arguably failed to see the fundamental differences between "higher" and "lower" levels of social organization.)

Spencer's ethics and political philosophy follow from this account of human nature. Beginning with the "laws of life," the conditions of social existence, and the recognition of life as a fundamental value, we can infer what will produce happiness. While progress was an inevitable characteristic of evolution, it could be achieved only through the free exercise of human faculties. Since individuals are "primary," individual behavior was fundamentally "egoistic."

The natural growth of an organism, then, required "liberty"—but Spencer held that, as individuals become increasingly aware of their individuality, they also become aware of the individuality of others and, thereby, of the *law of equal freedom*—that "[e]very man has freedom to do all that he wills, provided he infringes not the equal freedom of any other man" (*Social Statics*). Once this law is acknowledged, we have a moral basis for individual rights, and one can identify strains of a rights-based ethic in Spencer's writings. (This feature is evident, not only in his first major contribution to political philosophy, *Social Statics*, but in his later essays—several of which appear in *The Man versus the State* [1884].) Spencer saw associations with others as largely instrumental and contractual. He also followed earlier liberalism in maintaining that law is a restriction of liberty, and that this restriction, in itself, is evil and justified only where necessary to the preservation of a greater liberty. Not surprisingly, Spencer maintained that the arguments of the early utilitarians on the justification of law and authority and on the origin of rights were fallacious. He also insisted on an extensive policy of laissez-faire in economics and government.

Spencer's empirical method and his naturalistic account of knowledge are outlined in *First Principles*. He acknowledges that there are limits to human knowledge, and that the methods of the positive sciences are unable to explain all of reality. Specifically, we cannot know the nature of reality in itself (including complete knowledge of the nature of space, time, force, motion, and substance), and there was, therefore, something that was fundamentally "the Unknowable." While theists might regard this Unknowable as God, Spencer argued that we cannot know anything nonempirical—and so we cannot know whether there is a God or what its character might be.

Theism, he argued, cannot be adopted because there would be no way of determining whether there was any knowledge of "the Unknowable," such knowledge could not be acquired, and there would be no way of testing it. To this extent, his position on religion was agnostic (see AGNOSTICISM). Particular religious doctrines and practices could, however, be the appropriate objects of empirical investigation and assessment—and Spencer was a severe critic of them.

Spencer counted among his admirers both radical thinkers and prominent scientists. In the 1860s and 1870s the influence of his evolutionary theory was on a par with that of Darwin, and it has been said that, in 1896, "three justices of the Supreme Court were avowed 'Spencerians.'" His reputation was at its peak in the 1870s and early 1880s, and he was nominated for the Nobel Prize for Literature in 1902. In the last two decades of his life Spencer's health deteriorated significantly, and he died following a lengthy illness on December 8, 1903.

Though Spencer was a major figure in the intellectual life of the Victorian era, today he is remembered principally for his political thought, primarily for his defense of natural rights and for his criticisms of utilitarian positivism. His views are sometimes invoked by libertarians on issues concerning the function of government and the fundamental character of individual rights.

WILLIAM SWEET

SPINOZA, BARUCH or BENEDICT (1632–1677), Dutch philosopher. In 1656, at age twenty-three, Spinoza was excommunicated from the Amsterdam Jewish community, where he had been born and raised. The excommunication document mentions "the horrible heresies he practiced and taught," but refrains from spelling them out. Spinoza never returned to Jewish orthodoxy by repenting of his heresies. Nor did he convert to Christianity. Instead he reportedly wrote a defense of those heresies. It was not published or preserved, however, and we can only surmise how, if at all, it may have germinated into his subsequent writings. Around 1665 he announced in a private letter that he was writing a treatise about the Bible. It aimed, he said, at removing theological prejudices from potential philosophers, clearing his name of the charge of atheism, and vindicating the freedom of philosophizing in the face of overbearing preachers (Letter #30). These aims fit his *Theologico-Political Treatise* (1670) except in that, anticipating its notoriety, Spinoza published it anonymously. Nevertheless he soon became both execrated and celebrated throughout Europe as its author.

The *Treatise* is the philosophical founding-document of both scientific biblical criticism and modern liberal democracy—and so of modern liberal religion. Spinoza addresses Christians "who would philosophize more freely if this one thing did not stand in the way: they deem that reason has to serve as handmaid to theology." By loosening their attachment to biblical theology, Spinoza's *Treatise* would draw potential philosophers who are Christians to the theological and political benefits of a philosophy or science emancipated from traditional theological (and political) constraints.

Spinoza understood his project to be as pressing as it was far-reaching. Christians and other adherents of biblical religion were divided into competing, mutually persecuting sects. Despite widespread lip service to it, then, the Bible could hardly function effectively as Europe's social bond, that is, its common moral authority. Originally, the *Treatise* argues, Christianity taught simply "love, gladness, peace, continence, and faith toward all." It became a sectarian, persecuting religion only after it began defending its teachings by means of imported—Platonic and Aristotelian—philosophical arguments. These, being inherently dubious and controversial, led adherents into insoluble theological disagreements among themselves as well as with outsiders. Could the Bible be made to speak to adherents with a single voice again, Spinoza wondered, if both biblical theology and political society were refashioned on some new, scientifically validated basis? Spinoza's *Treatise* is a thought-experiment designed to answer this question philosophically and, at the same time, pave the way theologically and politically.

Of the *Treatise*'s twenty chapters, the first fifteen treat theological matters: redefining theological terms, establishing a scientific biblical philology modeled on modern natural science, and supplying a nonsectarian theology based on the new philology. These chapters culminate in a civil religion consisting of seven dogmas meant to be acceptable to all sectarians: (1) a supremely just and merciful God exists; (2) God alone requires our highest admiration, devotion, and love; (3) God is everywhere, and (4) all-powerful; (5) worshiping God consists solely in justice and charitableness; (6) such worship alone brings salvation, whereas hedonistic self-indulgence brings undoing; (7) God forgives the penitent. Such dogmas need not be true, the *Treatise* intimates, so long as they promote just and charitable behavior. Spinoza seems to have formulated them scientifically, by counting the frequency of occurrence of biblical "tenets" (*sententiae*), that is, opinions articulated at least once in the biblical text and isolable as sound bites. The seven listed, being in effect the most frequent, are least likely to foment controversy and are inherently compatible with the new philology, which identifies the Bible's most basic teachings with its most frequently repeated teachings.

The *Treatise*'s last five chapters consider the democratic basis of all political society, the pros and cons of the biblical theocracy, and the respective limits of religious and political authority. Political society, Spinoza argues, originates in a compact among self-interested individuals, each of whom transfers all his right or power to other self-interested individuals charged with making and enforcing laws for everyone's self-protection and self-enhancement. Individuals are apt to rebel, however, if they suspect rulers of abusing their delegated power. Practically speaking, the best society will be the most stable one consistent with individuals' enlightened self-satisfaction. It will not be a theocracy (ruled by religious authorities), nor a monarchy or aristocracy, but a democracy, since politically informed democratic majorities tend to restrict individuals' freedom least. More exactly, it will be a liberal democracy, where each remains free to think what he likes and say what he thinks. Even so, Spinoza places organized religion under the thumb of the political, to safeguard that freedom.

As Spinoza's *Treatise* deconstructs biblical theology to win philosophically inclined Christians to theological and political liberalism in general, so his posthumous *Ethics Demonstrated in a Geometrical Order* (1677) deconstructs natural (Platonic-Aristotelian) theology to win them to modern philosophy or science in particular. Its rhetorical structure imitates Euclid's *Elements*. It purports to derive pantheistic conclusions about God, mind, and the emotions "geometrically," that is, from antecedent definitions and axioms. Yet these, being merely stipulated rather than proved or even fully explained, appear rigged to favor conclusions resting as well, or instead, on independent empirical claims. The *Ethics*, then, is no homogeneous "system." Rather, its pantheistic façade houses strictly naturalistic arguments disjoined from anything theological. Among other things, Spinoza identifies God with the inexhaustible laws of nature, arranges mind and body in a strict parallelism (whereby thoughts always

correlate with whatever outside bodies affect the thinker's own body), and conceives emotions behaviorally so as to allow their scientific management by minds trained into shape by the *Ethics*. In sum, the *Ethics* is not exactly pantheistic nor simply atheistic but, oddly, both. It leads its addressee partly by deductive steps, partly by inductive leaps, to the introspective insight that our bodies and emotions are entirely subject to God's or nature's law-abiding necessities except while, and insofar as, we contemplate them "geometrically" on the premises of modern mathematical physics.

MARTIN D. YAFFE

SPIRITUALISM AND UNBELIEF. Spiritualism and unbelief have long had an ambiguous relationship. For some unbelievers, claims of contact with the afterlife threatened to confirm traditional religious beliefs; for others Spiritualism represented an application of scientific principles to offer logical explanations for phenomena previously viewed as the domain of faith alone. Briefly defined, *Spiritualism* is the belief that living persons can have contact with the dead or other beings in a spiritual realm. While elements of spiritualism have existed in many times, places, and cultures, Spiritualism as a philosophy had its heyday in nineteenth-century America and Europe.

Modern Spiritualism began with Emmanuel Swedenborg, "the father of modern Spiritualism." Swedenborg trained as an engineer, published Sweden's first scientific journal, and was a well-known and respected man of science. Visiting London in 1745, he saw an apparition, and began to concentrate his energies on a reinterpretation of the Bible and works of theology based on conversations with angels and spirits of the dead. He did not start the sect known as Swedenborgianism (or the "New Church" or "New Jerusalem Church"); rather, it was launched after his death by followers in the United States. Among Swedenborg's doctrines: God created humanity so as to exist simultaneously in the physical world and in the spirit world—both of which have societal structures and governments. Heaven is a normal society where souls continue as they might have on earth. Hell (where there is no Satan) is chosen by selfish, materialistic people who are free to commit any misdeeds they please, but they are punished (beaten by other souls) only if they become morally worse than they were when they were alive. Swedenborg's ideas influenced the "animal magnetism" movement of Franz Anton Mesmer, and writers such as William Blake, Samuel Taylor Coleridge, and Henry James.

Andrew Jackson Davis, "the Poughkeepsie Seer," is credited with providing a philosophical basis for Spiritualism more substantial than just the desire to communicate with the dead. In 1844, under the influence of mesmerism, he had a vision of Emmanuel Swedenborg and the Greek physician Galen. He published *The Principles of Nature* in 1845, based on his spiritualist experiences; the ideas expressed in this work combined Swedenborgianism with socialism in the vein of Charles Fourier. He believed he had a gift for spiritual healing, and practiced that art in New York for many years. His best-selling writings were considered heretical by many (see HERESY); he wrote, for example, that sin does not exist. In what would become a common theme among Spiritualists, he also lectured on women's rights and believed in equality of the sexes. His work is thought to have in turn influenced the development of Christian Science.

The Fox sisters were the first "professional" Spiritualists. Margaret "Maggie" and Katie Fox became associated with "rapping" noises in their home in Hydesville, New York, during the winter of 1847–48. The sounds were said to be communication from the spirit of a murdered peddler buried under the house. The rappings, later confessed to have started as a joke by the teenage Maggie and her younger sister, first became public when their mother called in neighbors to experience them. Rumors spread, and soon the family farmhouse was the destination of scores of curious visitors. The minister of their Methodist Episcopal church asked them to leave the congregation, believing them to be practicing witchcraft (see WITCHCRAFT AND UNBELIEF). Eventually the story of the mysterious haunting and the two young "mediums" reached attorney E. E. Lewis in nearby Canandaigua, New York, who came to investigate. In May of 1848 he published his findings in a pamphlet titled "A Report of the Mysterious Noises Heard in the House of John D. Fox, in Hydesville, Arcadia, Wayne County."

Lewis's pamphlet was read by the Fox sisters' elder sibling, Leah Fox Fish, a divorced single mother living in Rochester. Leah had previously read Davis's *The Principles of Nature* and was surprised to learn that her own family might be crossing the boundary between the worlds of the living and the dead. Leah paid her family a visit, and then invited her younger sisters to join her in Rochester. Leah was aware that Maggie and Katie were creating the rapping noises themselves (by cracking the bones in their toes), and shrewdly saw that the interest generated by her sisters' performances could be profitable. She began to promote them, starting with small private séances and moving to

larger public meetings. Meanwhile a growing group of followers began to collect around them, drawn largely from the ranks of the progressive and religiously disaffected, who saw Spiritualism as a new, universalist religion free of the prejudices and intolerance of traditional Christianity. Controversy continued to surround the sisters, but they eventually became national celebrities and the focus of a movement that engaged more than one million followers in America.

Nineteenth-century technology played a major role in the debates between Spiritualists and their many critics. In an age when photography was still new and a telegraph message was viewed by many as a miracle, technological means were used by both mediums and skeptics to prove or disprove the presence of spirits. Some methods of the Spiritualists, such as spirit photography, are regarded as obviously fake today. Photographs typically showed a double exposure of a sitter and an image of one or more spirits floating in space. Others showed ectoplasm, a white, fluid substance that emerged from the medium, shaped by spirits into physical forms such as "pseudopods," phantom hands that extend from the earthly stomach.

Other methods used by Spiritualists included communication via table tapping, slate writing, and automatic writing; trance mediumship; and physical manifestations such as levitation, movement of objects by unseen forces, and apparitions of supposed spirit beings. Public interest in and outcry about Spiritualism encouraged many scientific minds of the day to test and explain these various phenomena. The medical scientists William Alexander Martin and R. Frederick Martin of New York even named mediumship or "mediomania" as forms or symptoms of specifically female insanity during the 1870s. While many remained skeptical or developed rational explanations for these occurrences, some men and women of science were persuaded into the Spiritualist camp, including Henri Bergson, Carl Gustav Jung, and Juliet H. Stillman SEVERANCE. Other leading figures who became enticed to some degree by Spiritualism included Harry Houdini, Arthur Conan Doyle, and J. W. Dunne.

Spiritualists included countless activists within radical social movements. Nonresistants, or antiauthoritarian abolitionists, denounced large Christian denominations as collaborators in slavery. Many of that movement's members, including Sarah Grimké, Adin Ballou, and Henry C. Wright, became ardent Spiritualists because that philosophy complimented the profound individualism that had led them to feminism and antislavery. As one scholar wrote, "while not all feminists were spiritualists, all spiritualists advocated women's rights." Elizabeth Cady STANTON, Matilda Joslyn GAGE, Susan B. ANTHONY, Lucy Stone, and Lucretia Mott were all Spiritualists.

The most famous group devoted to the scientific study of Spiritualist phenomena was the Society for Psychical Research, founded in London in 1882 by Sir William Barrett and Edmund Dawson Rogers. They were joined by the so-called Sidgwick Group, the circle of friends surrounding Henry Sidgwick, a professor of philosophy at Cambridge. All were wealthy and had copious leisure time to devote to their investigation of psychical matters, which they tried to approach with scientific rigor. The original group's high social standing attracted the interest of other luminaries of the day, including Sigmund FREUD and William James. The work was of such interest that an American branch of the society was established in 1885; both societies still exist.

One of the most controversial episodes associated with the Society for Psychical Research involved Sir William Crookes, a noted physicist, chemist, and inventor, member of the Royal Society, and later president of the Society for Psychical Research. Crookes began investigating Spiritualists in 1871, possibly as a result of his grief over his brother's early death. His efforts to report on British Spiritualist D. D. Home were rebuffed by the Royal Society, but he later had them published in the *Quarterly Journal of Science*. Further studies on Home and Katie Fox were published in 1874. However, it was his dealings with the young medium Florence "Florrie" Cook and her materialized spirit of Katie King in 1873–74 that caused the greatest controversy. Cook would go into a trance and Katie would manifest bodily; sometimes Cook would be conscious and both would converse. Crookes and others saw and spoke with Katie, and Crookes's descriptions of her often lapsed into the rhapsodic, recounting her "perfect beauty . . . the brilliant purity of her complexion." Forty-four photographs documented the encounters, including one of Crookes arm in arm with Katie.

Crookes gave up his efforts to prove the truth of psychical phenomena after another medium he had reported favorably upon was exposed as a fraud. Serious allegations also arose concerning Cook, namely, that Katie King was actually a human imposter, and that Crookes was in collusion with Cook in order to cover up an illicit affair. To the end of his life, Crookes never renounced his belief in Spiritualism, and it seems more likely that his was a case of scientific instincts being overcome by feminine wiles.

Although Spiritualism is no longer the major social movement it was in the nineteenth century, it still exists and was one of the major influences on the development of the so-called New Age movement in the twentieth century.

ALISON M. LEWIS AND ROBERT P. HELMS

STANTON, ELIZABETH CADY (1815–1902), American women's rights activist and freethinker. One of the principal theoreticians for the American women's rights movement, Elizabeth Cady Stanton's genius supported the activism of nineteenth-century suffragists (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF), though her longtime friend Susan B. Anthony overshadowed her in popularity. Stanton's expansive, intellectual HUMANISM at once provided the theoretical backbone of the women's movement and made her anathema to the conservative Christian women who came to lead that movement in the post–Civil War era.

Early Education. The daughter of Margaret Livingston and Judge Daniel Cady, young Elizabeth informally studied law in her father's office in Johnstown, New York. In later years as she challenged legal inequities for women, this early education in jurisprudence served her well. Judge Cady desperately wanted a son but none of his male children survived. When Elizabeth's last surviving brother died, she informed her grieving father that she would endeavor to be like a son to him. Her academic success, first in Johnstown Academy then in Emma Willard's Troy Female Seminary, followed by a lifetime of political and intellectual achievements, failed to satisfy her father.

Marriage and Abolition. In 1840 Elizabeth Cady married the abolitionist Henry Stanton and accompanied him to London to an international meeting of antislavery agitators. It was there that she met the already noteworthy Lucretia Mott, with whom she shared her disgust at the convention's exclusion of female delegates. Mott, a liberal Quaker minister, encouraged the younger woman to read the writings of such freethinkers as Mary WOLLSTONECRAFT, Robert OWEN, and Frances WRIGHT, and to challenge the authority of the church and the Bible. Following her honeymoon in London, Stanton lived in Boston. There she and her husband moved in Garrisonian abolitionist circles, further radicalizing the young wife and mother and providing her with a wealth of intellectual and social stimulation. All of this would change when the growing Stanton family moved to the little central New York mill town of Seneca Falls in 1847.

Seneca Falls. Moving into a home purchased for her by her father, Elizabeth Cady Stanton set up housekeeping in Seneca Falls at the age of thirty-one. The novelty of domesticity was very soon replaced by a feeling of isolation, drudgery, and injustice, as she was left alone with her young children for lengthy periods while Henry pursued his political ambitions. Feeling women's limitations keenly, Stanton joined a group of liberal Friends, including Lucretia Mott, to plan the first women's rights convention that would be held in Seneca Falls in 1848. There Stanton, Mott, and others presented their Declaration of Sentiments, modeled after the Declaration of Independence. Stanton's decision to include a demand for the right of suffrage in the Seneca Falls declaration was first considered too radical, even by Mott herself. However suffrage soon became the central focus of the nineteenth-century women's movement. Stanton became arguably its most influential theoretician for the next half century.

Woman Suffrage. As the mother of seven children, family life somewhat circumscribed Stanton's ability to take on a public a role as a traveling lecturer. But her partnership with the never-married Susan B. Anthony, which began in 1851, allowed her to put forward her deeply intelligent strategy and rhetoric through Anthony's skilled political agency. Following the ratification of the Fourteenth Amendment protecting citizenship for black males, the women's rights movement split over issues of strategy. While the National Woman Suffrage Association (NWSA), which Stanton served as president from 1869 to 1889, insisted that suffrage must be achieved and protected by an amendment to the US Constitution, the more socially conservative American Woman Suffrage Association (AWSA) favored a state-by-state approach. (The two organizations merged in 1889.) Stanton contributed significantly to the suffrage cause as writer, speaker, activist, and editor. Joining forces with Matilda Joslyn GAGE and Susan B. Anthony to produce the monumental *History of Woman Suffrage* (1881–86), Stanton sought to preserve the story of women's struggle for suffrage for future generations.

Beyond Suffrage. During these years of leadership, Stanton refused to accept suffrage as a panacea for women's liberation. With Susan B. Anthony and Parker Pillsbury, Stanton edited the *Revolution*, which investigated a multiplicity of feminist concerns. Her intelligent insight into the complexity of women's degradation caused her to venture from the suffrage agenda on numerous occasions to treat more dangerous issues such as sexuality and divorce (see SEX RADICALISM AND UNBELIEF). Increasingly, she believed that religion played a primary role in maintaining women's inferior status. With other humanists in the women's movement, Stanton consistently challenged religious authority. Her condemnations of the illiberal dogmatism of organized religion and its followers led to ongoing controversy among rank-and-file suffragists.

After the Civil War, suffragists courted the support of wealthy, well-connected Christian women who believed the vote would give them political power to enforce their religious morality. To such women, Stanton seemed dangerously radical. Following the NWSA's merger with the AWSA in 1898, Stanton seemed all the more out of step with the sentiments of the evangelical leadership of a

new generation of suffragists. Even her longtime partnership with Anthony suffered, as Anthony found political need to divorce herself from Stanton's uncompromising humanist positions.

Marginalization. Finding suffrage too narrow for her great intellect, Stanton spent more and more time engaged in the intellectual conversations circulating among freethinkers. Throughout her later years, she maintained active correspondence with FREETHOUGHT leaders including the agnostic orator Robert Green INGERSOLL, for whom she felt an especial respect. Her growing disgust with the fundamentalist tenor of both the nation and the women's movement itself culminated in the publication of *The Woman's Bible* in 1895. Stanton was the primary contributor to this controversial biblical commentary, but she benefited from the skills of a team of authors, most of whom supported suffrage and all of whom would be marginalized by the mainstream women's movement (see WOMEN AND UNBELIEF). The National American Woman Suffrage Association (formed by the merger of NWSA and AWSA) was quick to distance itself officially from *The Woman's Bible* and its heterodox editor, despite protests by a minority of its members.

As a humanist, Stanton was dismayed by evangelical Christian usurpation of the suffrage cause. With the influence of such groups as the Women's Christian Temperance Union, the suffrage movement abandoned natural rights theory to promote women as social housekeepers in roles that merely expanded their domestic service as wives and mothers to the world at large. Such limited visions of women's potential led Stanton to reject her earlier populist idealism to declare that she would rather that women fail to achieve the right to vote than that they should enforce their religious morality on the nation. The poignant essay "The Solitude of Self," delivered in 1892 when she resigned the presidency of the National American Woman Suffrage Association, epitomizes her humanist ideals as a women's rights theorist. Unlike Susan B. Anthony, she never gained the approval of the new generation of suffragists like Carrie Chapman Catt and Anna Howard Shaw, who found her radicalism distasteful and dangerous. Decades after her death in 1902, Elizabeth Cady Stanton remained virtually ignored by the very movement she had been instrumental in creating.

MELINDA GRUBE

STEIN, GORDON (1941–1996), American freethought bibliographer, librarian, historian, and editor. Well known among atheists, freethinkers, and humanists worldwide (see ATHEISM; HUMANISM; SECULAR HUMANISM), Gordon Stein was a familiar contributor to both American and foreign "movement" publications. He made the celebration of secular humanism and the exposure of hoaxes of all kinds—religious, paranormal, and otherwise—his life's work. Much of his production was written with religious skepticism as his filter.

Stein was almost universally recognized as the foremost collector and historian of FREETHOUGHT materials of his generation, contributing an estimated six hundred book reviews to various publications. At his death his suburban house was filled with an estimated twenty thousand books. He was the longtime editor of the *AMERICAN RATIONALIST*, a small-circulation bimonthly devoted to analyzing and combating the irrationalities of religion. As its editor, his philosophy was to publish solely materials directly relating to freethought and irreligion—he felt there were more than enough other magazines to handle such related but tangential issues as the environment, feminism, and politics.

Stein's last professional position seemed the one he was destined for: assembling the libraries of atheism, humanism, and skepticism at the Center for Inquiry in Amherst, New York, from 1993 to his death in 1996. In addition he was a senior editor at *Free Inquiry*, the secular humanist magazine published out of the Center for Inquiry, and a technical consultant of the Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP), whose journal *Skeptical Inquirer* was also published from the center.

Stein was intensely private, so few knew the scope of his academic achievements. He held a bachelor's degree in psychology from the University of Rochester; three master's degrees, one from Adelphi in zoology and two from UCLA in management and library science; and a doctorate in physiology from Ohio State.

His publications included two influential anthologies; three significant encyclopedias, one the predecessor to the present work; and a number of bibliographies and other works.

In *The Encyclopedia of the Paranormal* (1996), Stein took a skeptical approach to all aspects of the paranormal. Still, his approach was fair-minded, with proponents of paranormal claims included among contributors with expert skeptical credentials. In *The Encyclopedia of Hoaxes* (1993) he brought together examinations of many of history's most intriguing deceptions. These included not only paranormal and religious claims but

also hoaxes in politics, science, and history. His masterwork was *The Encyclopedia of Unbelief* (1985), which provided unbiased and hard-to-find information about the nonreligious point of view, and was added to the reference shelves by libraries worldwide.

His two anthologies, *The Anthology of Atheism and* RATIONALISM (1980) and *A Second Anthology of Atheism and Rationalism* (1987), brought together important but obscure atheist and freethought texts of interest to historians, students, and humanist or atheist activists.

Stein's most academically significant work might be his four freethought bibliographies, the only such guides to a specialty literature that is otherwise almost destitute of formal scholarly apparatus: *God Pro and Con: A Bibliography of Atheism* (1990), *Freethought in the United Kingdom and the Commonwealth: A Descriptive Bibliography* (1981), *Freethought in the United States: A Descriptive Bibliography* (with Marshall Brown, 1978), and *Robert Green* INGERSOLL*: A Checklist* (1969).

Stein lectured widely, frequently debated believers on topics such as the existence of God, and in the age before online book buying traveled the country to search antiquarian booksellers for rare and obscure works for the Center for Inquiry collection or his own personal library.

Stein was twice married and divorced: his first wife, Barbara, bore him a daughter, Karen; his second wife was attorney Eve Triffo.

He expressed his philosophy in a 1985 work, "What Is Rationalism?" in which he wrote: "We should always keep an open mind about any new phenomenon in nature. To merely say, 'That's impossible, therefore it doesn't exist,' is to commit a severe error. A much better approach would be to say, 'That's quite unlikely, but show me the evidence you have that say that it may be so.'"

BERNARD KATZ

STEPHEN, SIR LESLIE (1832–1904), English editor and scholar. While he regretted not having devoted more time to "creative" writing in moral philosophy, Sir Leslie Stephen's terse historical and biographical surveys represent an outstanding achievement and an exemplar in English literature. He was largely responsible for popularizing AGNOSTICISM among England's liberal intelligentsia.

Stephen was born in Kensington on November 28, 1832, into a cultivated and well-connected family. His father, Sir James, was an abolitionist politician; his mother, Jane, daughter of the evangelical rector of Clapham. Deemed a sickly child with a "precociously active brain," Leslie went to private schools, Eton, and King's College, London, but flourished only at Trinity Hall, Cambridge, where he was an outstanding endurance athlete and mathematics scholar. There in 1854 he gained a fellowship and assistant tutorship which obliged him to take holy orders within a year. He became a deacon in 1855 and a priest in 1859.

Reading the controversial *Essays and Reviews* (1860) and works by John Stuart MILL, Auguste COMTE, Herbert SPENCER, Charles DARWIN, and Immanuel KANT led Stephen to religious SKEPTICISM "without mental perturbation." He avoided chapel services, resigned his tutorship, but retained his fellowship. In America (1863) he met US literati. Back in Britain, in 1864 he left Cambridge for London and contributed to prestigious journals like the *Saturday Review*, *Fraser's Magazine*, and *Cornhill Magazine*, whose bland editor he was from 1871 to 1882, encouraging writers like Thomas Hardy, Henry James, and Robert Louis Stevenson, who would later become famous. On marrying Harriet Thackeray, daughter of William Makepeace Thackeray, in 1867, he resigned his fellowship and joined Thackeray's household. He also started taking bar dinners, a social prerequisite to a legal career, in case his "potboiling" literary journalism failed.

Keen on mountaineering, he became president of the Alpine Club (1865) and editor of its journal (1868). His first book was an English translation of *Die Alpen* (1861) in 1871. The seventies also saw his most important agnostic works: *Essays on Free Thinking and Plain Speaking* (1873); *History of English Thought in the Eighteenth Century* (1876), featuring deist and utilitarian writers (see DEISM); and four essays in John Morley's *Fortnightly Review*, including "An Agnostic's Apology" (June 1876). In 1875 his wife died. He relinquished holy orders, left the Thackeray household, and married Julia Duckworth, widow of Gerald, in 1877. After writing numerous acclaimed biographies for Macmillan's *English Men of Letters* and other series, he

published *The Science of Ethics* (1882) to disappointing reviews. That year saw the launch of the *Dictionary of National Biography*, with Stephen as editor until 1890–91, and Sidney Lee as subeditor and future editor. Stephen himself contributed 283 signed entries.

During the 1880s, Stephen lectured at Moncure CONWAY's liberal religious chapel and was associated with the (London) Ethical Society (1886). In 1892 he became president of the London Library and West London Ethical Society. He drafted the (unsatisfactory) definition of RATIONALISM for the RATIONALIST PRESS ASSOCIATION and became its first honorary associate in 1899. Among numerous honors, he was knighted in 1902. He died on February 22, 1904.

DAVID TRIBE

STIRNER, MAX (1806–1856). German philosopher and nihilist. Born Johann Kaspar Schmidt in Bayreuth, Bavaria, Max Stirner derived his pen name from a childhood nickname (*Stirn* refers to his high forehead). He initially lived a double life: by day, a mild-mannered schoolteacher at an academy for young ladies in Berlin; by night, a fierce and unrelenting critic of organized religion, public education, and all forms of government. Hence the need for a nom de plume.

Largely a forgotten figure today, Stirner had a major influence on several philosophical movements, including anarchism (see ANARCHISM AND UNBELIEF), egoism, libertarianism, MARXISM, and EXISTENTIALISM, and his ideas can be found in the works of such disparate—indeed antithetical—writers as Friedrich NIETZSCHE, Mikhail BAKUNIN, Karl MARX, and Ayn RAND. Stirner was in fact initially a friend and colleague of Marx, who published Stirner's essay "The False Principle of Our Education" in 1842. But the two later had a bitter break, and Marx's *The German Ideology* has a large section attacking Stirner.

Stirner's best-known work was his 1844 *Der Einzige und sein Eigentum* (The Ego and Its Own), in which he argued for an extreme form of egoism. The only truth one can know is that one exists. All existing beings seek what is in their own interest. The human individual will is constantly besieged by the "ought"—relational bonds from without which attempt to conform the will and subject it. Worst of all are "fixed ideas," concepts that one is taught never to analyze or criticize. Stirner was a strong critic of all systematic belief systems. Every human being is completely and utterly unique, yet abstract belief systems deny this basic fact and attempt to fit humans into preexisting categories or formulas. For Stirner, a belief should be voluntary, and the best way to test this is to see whether or not one can choose *not* to believe it. Any thought which cannot be so overturned is, in his phrase, a "wheel in the head." Likewise, the society in which an individual lives inculcates certain rules and regulations which became a part of that person's very self—a "gendarme in the breast." A true egoist is one who can exorcise such wheels and gendarmes. The two most powerful and pernicious beliefs implanted into individuals at an early stage are religion and patriotism, which encourage one to make one's very existence subservient to the needs of church and state. The church encourages one to sacrifice in the name of God, the state encourages one to sacrifice in the name of the law, and optimistic liberals like George Hegel and Ludwig FEUERBACH encourage one to sacrifice for the good of humanity. All such causes are mere abstractions, ideals, with the shared purpose of robbing individuals of their freedom, or even of their awareness that they are free.

Following the logic of this argument, every belief is merely provisional, which leads to a type of nihilism. Most of Stirner's contemporaries, including Nietzsche (whose own debt to Stirner's work remains controversial), wished to steer clear of so radical a conclusion, but Stirner was fearless (at least in his writings). Anticipating Jean Genet, he advocated committing criminal acts that assert the ego and reject the sacred. If enough such free acts occur, the state itself will collapse, bringing about an initial (quoting Thomas HOBBES) "war of all against all." But after such a war, there will be a union of egoists—a true anarchist society where all decisions will be made on the basis of shared human needs, with real consensus. There would be a kind of dynamic balance among free individuals.

Stirner's later works did not receive the same attention as *The Ego and His Own.* His wife left him in 1847, and he died in poverty and obscurity in 1856. But his extreme defense of egoism remains much discussed in libertarian and anarchist circles.

TIMOTHY J. MADIGAN

STOICISM. Stoicism was the dominant philosophical movement of the Hellenistic age. It was founded by Zeno of Citium around 300 BCE and developed by Cleanthes of Assos and most importantly Chrysippus of Soli, who is credited with developing early Stoicism into a comprehensive system. Stoicism takes its name from a decorated porch in the Agora at Athens where the members of the school would gather for lectures. Early Stoics engaged in protracted epistemological disputes with the skeptical philosophers of the Academy. The Stoics of the middle period (second to first century BCE), whose most notable representatives were Panaetius of Rhodes and Posidonius of Apamea, introduced the philosophy to the Roman world, and the writings of Seneca, Epictetus, and the great Stoic emperor Marcus Aurelius mark the latter, "Roman" period (first to second century CE), which was for the most part concerned with ethical subjects. Stoicism was rediscovered in the Renaissance and later came to influence Enlightenment thought and American transcendentalism. Ralph Waldo EMERSON's library contains numerous volumes by Epictetus, Marcus Aurelius, and other Stoics whom he apparently had been reading at least since his studies at Harvard. The core transcendentalist notion of finding ultimate reality and truth in a universal rational Nature is an echo of Stoic themes.

Although no formal writings of early Stoicism survive in complete form, reconstructions have been undertaken based on fragmentary quotations and more substantive accounts by others, often critics of the movement. Such reconstructions present us with a picture of a coherent, rigorously constructed system encompassing physics, logic, and ethics. In the physical theory of the Stoics, the fundamental ontology of the universe is made up of two coextensive principles: matter, thought of as entirely passive and inert, and an organizing principle of eternal reason, logos, or "god." Matter and reason are combined into the four elements of earth, water, air, and fire, which are the basic phenomena at the observable level. Reason is immanent in the universe in the same way that the rational souls of human beings are immanent in them. Indeed, the universe is conceived as an organism with an optimal arrangement of its parts. Any appearance of imperfection is an illusion resulting from the failure to see the proper place of some phenomenon in the larger design. The rational soul structures and directs the world in every detail in accordance with a predetermined plan. The plan is a sequence leading from an intial state of fire, followed by the generation of the other elements, the creation of the phenomenal world, and an eventual return to a fiery conflagration. This preordained cosmic cycle recurs endlessly. While there was a diversity of opinion among Stoics, it is fair to say that their concept of the divine was at most a form of universal DEISM.

Air and fire in combination form the ubiquitous life force of pnuema ("breath"), which interpenetrates all bodies. Its outward motion determines objects' observable external qualities; its inward motion maintains them as integrated wholes. Pneuma exists in different gradations. The kind of pneuma that gives form to an inanimate object is called a "tenor." The kind of pneuma found in plants is "physique," literally, "nature." The pnuema of animals is soul (*psychê*); in rational animals, it is further described as the faculty in command of thought and decision, the *hÍgemonikon*. Human beings also depend on physique for purely physiological and autonomic actitivies. Thus, Stoicism has no place for an immaterial soul or mind. The soul of a person is pnuema, and pneuma is a kind of matter, subject to generation and destruction like other matter. At the same time, the theory of an independently existing pnuema makes physically possible the survival of the soul after biological death. Some Stoics, such as Chrysippus, maintained that the souls of the wise exist after death until the next cosmic cycle.

In ethics, Stoics defended a kind of natural law theory which was strictly speaking nontheistic and nonreligious, but predicated on the premise of a perfectly fine-tuned rational nature. The goal of the good life is living in agreement with nature. One's choices are virtuous when they follow their proper functions. The root of vice is false value judgments, which result when the passions overrun rational evaluation and invest value in things that are actually morally indifferent in the final analysis (food, drink, sex, shelter, and so on). For those who find themselves playing a part in the grand, inevitable, and perpetually recurring drama of Stoic cosmology, wisdom consists in accepting fate with calm fortitude and welcoming the eventual universal conflagration.

Many early Christians from Paul onwards sought to draw connections between their fledgling faith and the ascendent Stoicism of the empire, even co-opting elements of the philosophy; for instance, the cosmopolitanism of Epictetus. Many early Christian texts were addressed to Roman rulers, attempting to persuade them to end their persecution. Because such rulers, like Marcus Aurelius, were schooled in Hellenic philosophy, Christians found it necessary to justify their religion in Stoic and Epicurean terms. In Acts 17, when in Athens Paul encounters Epicurean and Stoic philosophers curious about Christianity, he characterizes it to them in a way that would appeal to Hellenistic ears: "[God] hath made of one blood all nations of men for to dwell on all the face of the earth, and hath determined the times before appointed, and the bounds of their habitation. . . . For in him we live, and move, and have our being; as certain also of your own poets have said." When Paul came to the story of the resurrection and the promise of the eternal afterlife, however, the this-worldly Athenians began to mock him. As Marcus Aurelius wrote in his *Meditations*: "fail not to note how short-lived are all mortal things, and how paltry—yesterday a little [semen], tomorrow a mummy or burnt ash. Pass then through this tiny space of time in accordance with nature, and come to thy journey's end with a good grace, just as an olive falls

when it is fully ripe, praising the earth that bare it and grateful to the tree that gave it growth."

AUSTIN DACEY

STOUT, SIR ROBERT (1844–1930), New Zealand jurist, politician, and educator. Sir Robert Stout served as premier and chief justice of New Zealand and chancellor of the University of New Zealand. He supported the RATIONALIST cause throughout his life and was also a leading Unitarian (see UNITARIANISM TO 1961). Stout has been described as being to New Zealand what Robert Green INGERSOLL was to America and Charles BRADLAUGH was to Britain.

Born on September 28, 1844, at Lerwick in the Shetland Islands, Scotland, from an early age he attended Sunday afternoon family discussions on scientific, religious, and political topics. He later said that "theological disputation was part of social life." These experiences led him to reject sectarianism and religious dogma.

In 1864 Stout emigrated to New Zealand, where he qualified as a lawyer. While at Otago University he became a friend of Professor Duncan Macgregor, a rationalist and advocate of the English philosopher Herbert SPENCER. Stout also adopted Spencer's philosophy. In 1876 Stout married Anna Paterson Logan, who descended from a prominent family of Dunedin freethinkers.

Stout was elected to parliament in 1876, where he took an important role in debates over the 1877 Education Bill, which provided for "free, secular and compulsory" primary education. He opposed denominational influence in university education and voted against the introduction of divinity degrees. He also worked to remove the influence of the Presbyterian Church over appointments to chairs at Otago University.

Stout was also active in FREETHOUGHT work. In his inaugural address to the Dunedin Freethought Association in 1880 he said, "Recognize no authority competent to dictate to us. Each must believe what he considers to be true and act up to his belief, granting the same right to everyone else."

Stout's political career reached its height between 1884 and 1887, when he was premier, attorney general, and minister of education. A year later he was out of politics and returned to his law practice. In 1893 he returned to parliament but had little political influence during his remaining five years. Upon resigning from the House he was appointed chief justice in 1899, a position he held until 1926.

Upon his retirement in 1926 he was appointed to the Legislative Council, New Zealand's Upper House, where he defended secular education and opposed the introduction of Bible reading and prayer in schools.

Stout played a significant role in the development of the New Zealand university system; from 1885 to 1930 he was a member of the Senate of the University of New Zealand and between 1903 to 1923 its chancellor. He received honorary doctorates from Manchester and Edinburgh universities and from Oxford.

Stout espoused a humanist approach in his writing and speeches during the last ten years of his life. In his time Stout was one of only three New Zealanders who were honorary associates of the RATIONALIST PRESS ASSOCIATION. In an address to the Wellington Unitarian Church he said: "If only we could get us a Humanist religion we would be able to solve many problems yet unsolved. But now Humanism has developed and we can hope for better days."

WAYNE FACER

STRAUSS, DAVID FRIEDRICH (1808–1874), German biblical scholar. David Friedrich Strauss's *Life of Jesus Critically Examined* (1835), published when he was a mere twenty-seven years old, remains perhaps the greatest book on the gospels ever penned. After a brief pastoral tenure in southwestern Germany, Strauss went to Berlin to study with G. W. F. Hegel, who died just after Strauss's arrival. Two years later, Strauss himself obtained a teaching post at Tübingen University, where the great F. C. Baur also taught. Three years following, upon the explosive appearance of *The Life of Jesus Critically Examined*, Strauss was dismissed from his post over his heresies (see HERESY).

In his scrutiny of the gospels, Strauss fought a two-front war, refuting both the orthodox apologists who defended the text as inerrant scripture, and the religious rationalists who denied supernatural causation yet tried to save the appearances, arguing that the gospel events took place as described but with natural causes. For them, Jesus walked *by* the sea, not on it. He fed the multitude with supplies passed to him from Essenes in the cave behind him, and so on. Strauss mercilessly exposed the contrived harmonizations of both groups, demonstrating in case after case that each gospel episode had to be understood as neither hoax nor history but rather as *myth*, fanciful tales, sometimes told to make a religious point and often modeled upon Old Testament tales of Elijah, Elisha, and Moses.

Strauss adduced many examples of legends from Judaism and other religions, demanding to know why these ought to be dismissed as legends when their gospel counterparts were soberly accepted as history. Frequently he exposed the inaccuracies and anachronisms of the gospels by showing how no amount of ingenuity had proven able to reconcile their notices of, for example, Quirinius's census—Luke's occasion for Mary and Joseph going to Bethlehem—with extrabiblical documentation. But perhaps the greatest of Strauss's contributions to the study of the gospels is his countless juxtapositions of contradictory accounts between the gospels, or even within a single gospel.

John the Baptist provides an excellent set of examples of Strauss's eagle-eye scrutiny of the gospel texts. In Mark's and Luke's Jordan baptism scenes, there is nothing to suggest that John even knew who Jesus was. In Matthew and John, John the Baptist recognizes Jesus and, in John, publicly endorses him. But in Matthew, the Baptist defers to Jesus as soon as he sees him, before the descent of the Spirit, while in John's version, the Baptist says he recognized Jesus as the messiah only when he saw the Spirit descend upon him. According to Matthew 11:2ff. and Luke 7:18ff., John sent a pair of disciples to inquire of Jesus whether he might be the Coming One. How does this uncertainty square with the earlier recognition/endorsement in Matthew? Had John's previous faith begun to waver? No, we get the opposite impression: John sends his messengers because he has heard a report of Jesus's miracles. Miracles would hardly cause a former believer to doubt, but they might well light the spark of hope in one who had not heretofore believed. Here as elsewhere Strauss insists that, when faced with two versions of a story, the historian must reject the more spectacular in favor of the less spectacular. If John were known to have believed in Jesus, who would ever construct a story in which he only wondered? But if John had never done more than wonder, it is natural to suppose Christians would later tell a "better" story in which the famous saint endorsed their own hero.

Likewise with the Transfiguration scene, where the contradictions occur within a single gospel, Mark. In Mark 9:2–8, the disciples see Elijah, the messianic forerunner, with Jesus and Moses atop a mountain. But afterward, in verses 11–13, they ask, "Why then do the scribes say Elijah must come first?" as if this expectation has so far been disappointed. And Jesus answers that the fulfillment was figurative: "Elijah" was actually John the Baptist. Here are two mutually exclusive Christian devices aimed at solving the same problem: why no Elijah if Jesus is the true Messiah? One answer is the figurative one: John the Baptist. The other is the literal one: he came but few saw him. It may be that neither is historical, but we can be sure the Transfiguration vision is secondary. If Christians knew of Elijah's glorious epiphany, who would ever resort to the strained John the Baptist business?

Having demolished the credibility of the gospel narrative, Strauss took for granted the authenticity of much of the "sayings material" (verses recounting the sayings of Jesus), to the extent that he imagined the historical Jesus had (reluctantly) accepted acclamation as the Jewish Messiah. Others, like Bruno BAUER and Rudolf Bultmann, would later apply Strauss's magnifying glass to the sayings of Jesus with equally devastating results.

ROBERT M. PRICE

SWEDEN, UNBELIEF IN. Statistically, unbelief (ATHEISM, AGNOSTICISM, SECULAR HUMANISM, RATIONALISM, and FREETHOUGHT) seems quite strong in Sweden. As of 1999, Sweden's population was 8.9 million and the official religion was the Lutheran Church of Sweden. Yet according to the 2001 *World Christian Encyclopedia*, 29.4 percent of the population in 1995 was without religious belief, up from 28.7 percent in 1980 and just 1.1 percent in 1900. According to this source, Sweden was the most secularized of twenty-one Western countries in 1980 and again in 1995. According to the 1998 *Britannica Book of the Year*, as of 1995 religious affiliation in Sweden was as follows: Church of Sweden, 86.1 percent (nominally; about 30 percent are nonpracticing); Roman Catholic, 1.9 percent; Pentecostal, 1 percent; others, 11 percent. These figures are approximately compatible with the figures of the *World Christian Encyclopedia*. Yet in *Religious*

Freedom in the World, editor Paul Marshall presents the following church membership breakdown for 1999: Evangelical Lutheran, 90 percent; Roman Catholic, 1.5 percent; Pentecostal, 1 percent; Muslim, 4 percent; and other religious groups, 3.5 percent. Marshall does not mention unbelievers, as if there were no unbelievers at all in Sweden in 1999!

Organized unbelief in contemporary Sweden goes back to 1979 when the Human-Etiska Förbundet (The Human-Ethical Society) was founded. Its first chair was José Santana. At its foundation, the aims of Human-Etiska Förbundet were said to be "to combat and destroy the obstacles standing in the way of complete freedom of thought . . . to work for a true non-confessional education in the schools . . . to support and make known the right to a concept of life without faith in gods or religions . . . to establish cultural contacts with nonbelievers of other countries."

Before long, the leadership was taken over by the art dealer Anders Aspegren, who was the leader for about ten years and then withdrew for reasons of health. Santana withdrew from the organization a few years after its founding. Other leaders have included lawyer Johan Rudolf Engström, police officer Per Claesson, and organist Ebon Stranneby, the only woman among the first leaders. In 1994 Gunnar Ståldal was elected chair. He had an education in theology and was for many years a teacher of religion at a secondary school. He was followed by Mikael Göransson, a businessman, who served as chair until 1999 when Professor Carl-Johan Kleberg became chair. In 2004 Ludvig Grahn succeeded Kleberg as chair.

In 1999 Human-Etiska Förbundet changed its name to Humanisterna (The Humanists). In 2004 Humanisterna had thirteen hundred members.

Whereas Humanisterna remains a relatively weak organization, Sweden can take pride in quite a number of individual unbelievers of impressive stature. As in other countries, unbelief in Sweden began with unorganized individuals. One of the first was Olof von Dalin, an eighteenth-century historian, poet, and author of parodies and satires, some of them anticlerical (see ANTICLERICALISM). Dalin was the foremost Swedish writer of his time.

More important than Dalin was Johan Henric Kellgren, an author, librarian, and secretary to King Gustav III. Kellgren was influenced by John LOCKE and thinkers of the French Enlightenment including Julien Offray de LA METTRIE and VOLTAIRE. He became a devoted advocate of freedom and a critic of religion; he praised the French Revolution. Some of his satires were considered to be blasphemous (see BLASPHEMY). Kellgren is probably the foremost representative of the Swedish Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE).

After Kellgren, Fredrik Wilhelm Christian Areschoug was one of those who moved in a secular direction. He was a botanist and an admirer of Charles DARWIN, whose ideas he introduced at Lund University. Another interesting early figure was the publisher and writer Gustav Joachim Leufsted. Around 1870 he gave a lecture in which he criticized the church and dogmatic Christianity. This created quite a stir; critics branded Leufstedt the Antichrist.

Though these individuals moved in a secular direction, they were apparently not atheists. The first Swede who can be reliably identified as an atheist is Anton (Kristen) Nyström, a physician, writer, and political and social activist. He is one of the great names of Swedish SECULARISM. In and after 1873, Nyström came under the influence of Auguste COMTE. By the 1860s he had abandoned any belief in a personal god. During these years he continued to recognize only the existence of a supreme being, which he interpreted as a "summing-up of the eternal laws, the physical as well as the intellectual and moral laws." Comte's slogan "To Live for Other People" strongly appealed to Nyström, and for him this meant work for the underprivileged in society.

If Nyström was probably the first known Swedish atheist, another significant one was Viktor (Emanuel) LENNSTRAND. He was an atheist during the final years of his life, beginning in 1887.

Another early Swedish atheist, (Johan Gustav) Knut Wicksell, was for a few years a good friend and collaborator of Lennstrand. He was the first in Sweden to discuss birth control (see BIRTH CONTROL AND UNBELIEF). Beginning in 1880, Wicksell acquired a reputation as a dangerous champion of radical ideas. A "defense nihilist," he doubted the utility of the Swedish armed forces. He opposed teachings of the church that he believed contrary to historical facts, and in this way acquired the reputation of being antireligious. Apart from his roles as a social reformer, lecturer, and journalist, Wicksell also became a professor of economics at the University of Lund. Wicksell's radical past pursued him also during his time as a professor and in 1908 he was prosecuted for BLASPHEMY and sentenced to two months in prison for his lecture "The Throne, the Altar, the Sword, and the Pocketbook."

A further interesting Swedish atheist was Bengt Lidforss. He was a botanist, a writer, and a politician. Lidforss carried out thorough studies in cytology, physiology, and heredity; he became a professor at Uppsala in 1910 and at Lund in 1911. He was a capable popularizer with strong political and social interests. He wrote in the social democratic press on literature, religion, and politics. His articles have a dazzling style and are sharply polemical, but also full of humor.

A final great atheist to be mentioned here is Ingemar Hedenius. From 1947 until his retirement in 1973, Hedenius was professor of philosophy at Uppsala, specializing in moral philosophy. During the 1940s Hedenius had also acquired a reputation as a dangerous radical. Apart from his more technical and difficult writings, he also published more popular writings and in 1948 declared himself a freethinker. His reputation as a religious radical was signifi-

cantly strengthened with the publication of his 1949 book *Tro och vetande* (Faith and Knowledge). The book created a sensation, becoming the focus of prolonged attention in newspapers, journals, and in other books. The attention particularly focused on Hedenius's essays dealing with religion, in which Christianity was sharply criticized.

FINNGEIR HIORTH

SWINBURNE, ALGERNON CHARLES (1837–1909), English poet, dramatist, and critic. Algernon Charles Swinburne was born in London on April 5, 1837, to a distinguished Northumbrian family. His mother brought him up in High Church Anglicanism, while his grandfather, Sir John Edward Swinburne, a devotee of FREETHOUGHT and republicanism, opened to young Algernon his sizable library.

Swinburne attended Eton and Oxford, but graduated from neither institution. At Oxford, Swinburne befriended not only members of the Pre-Raphaelite group, but also Old Mortality Society leader John Nichol, who is credited with effecting Swinburne's final break from Anglo-Catholicism. While Swinburne's religious thinking changed over time—assailing organized religion, exploring pantheism (see PANTHEISM AND UNBELIEF) and HUMANISM, and propounding a concept of art-as-religion transmitted by the poet-priest—AGNOSTICISM remained at its core.

From 1860 to 1879 Swinburne lived in London, actively writing but also drinking excessively, ruining his already delicate health. His first important work was *Atalanta in Calydon* (1865), modeled after Greek tragedy. In it, he called God "the supreme evil." The publication of *Poems and Ballads* in 1866 caused a scandal with its antitheisitic, erotic, and even sexually pathological themes. The year 1871 saw the volume of republican poems, *Songs before Sunrise*. Swinburne was also a brilliant parodist, as seen not just in parodies like *The Heptalogia* (1880) but in parodic elements of his serious verse, usually the appropriation of Christian symbols for other purposes including attacks on religion.

In 1879 Swinburne was taken under care by Theodore Watts-Dunton, and remained with his friend in Putney, a London suburb, for the final thirty years of his life. Watts-Dunton weaned Swinburne from alcohol and shielded him (some say overly so) from outside influences. One of the finest poems of this period is the erotic and anti-Christian epic *Tristram of Lyonesse* (1882).

Swinburne died of influenza on April 10, 1909. Friends who knew of Swinburne's longstanding hostility to religion were incensed when Anglican rites were read at the funeral.

From the mid-twentieth century on, there has been not only a critical reappraisal of Swinburne's later work—previously dismissed—but also a general rediscovery of the poet's intellectual complexity and lyrical beauty.

REBECCA BIZONET

SWITZERLAND, UNBELIEF IN. Switzerland, or, more precisely, the Swiss Confederation, exists as a democratic organization of small territories—later named Cantons—which have united against outside powers (princes, monarchs, and emperors) to maintain their freedom since approximately 1291. Over the centuries a modern republic developed with a tradition of freedom, four national languages, and a federal structure that was very progressive when it was established in 1874. The following articles of the 1874 constitution are very significant for women and men who no longer wish to be part of a religion (translation is approximate):

> Art. 49. The freedom of belief and conscience is immutable. No one may be forced to take part in a religious community, religious instruction or religious ceremony or be punished in any manner for their religious views. The religious education of children up to and including their sixteenth year is the competence of the holder of parental authority. The exercise of civic or political rights can under no condition be restricted by conditions of a religious or confessional nature. Religious belief does not release from observance of civic duties. No one is required to pay taxes that are specially intended for cultic or religious purposes that they are not party to.
>
> Art. 50. The Cantons and the Confederation retain the right to take appropriate measures in order to maintain order and peace in public life between the members of different confessions, as

well as against the intervention of religious authorities in the rights of citizens and the state. . . . The establishment of bishoprics on Swiss territory must be approved by the Confederation.

Art. 51. The Jesuit Order and the affiliated societies are not permitted in any part of Switzerland, and their members are forbidden to exercise any activity in churches or schools. This restriction can be extended by a decree of the Confederation to other religious orders whose activities are deemed to be dangerous to the state or disturb the peace between the confessions.

Art. 52. The establishment of new or revival of dissolved religious houses or orders is not permitted.

The same spirit infuses the federal civil law code: "Art. 277 . . . If children have reached their sixteen year, their right to decide for themselves over their religious confession are inalienable."

Owing to this spirit of freedom under the law, freethinkers (see FREETHOUGHT) could publicly organize and participate in public life. Some of the more famous freethinkers of this period were Gottfried Keller, author and atheist; August Forel, psychiatrist and natural scientist whose portrait adorns the Swiss 1000 Franc note; Ernst Brauchlin, educator, author, and former president of the Swiss Freethinkers movement; Arnold Heim, geologist and author of the book *Reason Instead of Religion*; Jakob Stebler, popular author and president of the Swiss Freethinkers Association; Max Frisch, author, atheist (see ATHEISM), and freethinker; and Friedrich Duerrenmatt, author, atheist, and son of a pastor.

The first formal freethinkers' group in Switzerland was formed in Zurich in 1870, followed a few years later by organizations dedicated to propagating freethought in French-speaking Switzerland and the Canton of Tessin. But it was with the founding of the Swiss-German League of Freethinkers on April 12, 1908, in Zurich, under the chairmanship of the engineer August Richter, that an organization first arose with the financial and personal prerequisites to develop a national freethinkers' movement.

Two months after the foundation of the league, intolerant church authorities demonstrated their continuing willingness—and capacity—to persecute freethinkers. A lecture titled "Monism [approximately similar to Unitarianism (see UNITARIANISM TO 1961)] and Christianity" held by August Richter in Lucerne caused such enthusiasm that local freethinkers announced their intention to form a local association. The inaugural meeting was scheduled for one week later. Richter was arrested as he traveled to Lucerne to attend, and was imprisoned for two weeks on a charge of BLASPHEMY, followed by an exile from the Canton of Lucerne for eight years. The judgment was overturned by the Federal Supreme Court on April 3, 1909.

The financial situation of the freethinkers did not permit them at first to print their own paper, and they collaborated with a German Monist group on a joint publication. On April 1, 1915, the first issue of *Swiss Freethinker* was published. This periodical has continued uninterrupted to the present day under various names, except during the war years of 1919 to 1921.

Repression of freethought by the churches continued unabated until approximately World War II. Every conceivable means was brought to bear. This reached a peak in 1933, following the repression of the freethinkers in Germany by the National Socialists (see GERMANY, UNBELIEF IN). Mueller, the member of the Swiss parliament for Grosshoechstettern (Bern), introduced a motion demanding similar measures against the activities of freethinkers in Switzerland. The blatant sympathy of the Swiss Reformed and Catholic churches for this repression of alternative worldviews is very informative in this context. The *Reformed Swiss News* (*Reformierte Schweizer Zeitung*) of April 28, 1933, offered the opinion that the new government in Germany was correct to repress anti-Christian organizations. The Catholic *Lucerne Daily News* (*Lucerner Tagblatt*) congratulated Chancellor Engelbert Dollfuss of Austria for the repression of freethinkers there on June 23, 1933 (see AUSTRIA, UNBELIEF IN).

Swiss freethinker meetings were continually interrupted by violent means during this period. It was often necessary to cancel advertised freethought lectures at the last minute because those responsible for the lecture venues were placed under such massive pressure that they preferred to commit breach of contract than face the consequences of allowing the scheduled freethought event to go ahead. During this period, even membership in a freethinker organization could be reason enough for a household breadwinner to be fired. Hence it was necessary in 1931, for example, to dissolve one growing freethought group, the Toggenburg (Saint Gall) Association, in the face of united pressure by the church and employers. The churches also demanded an absolute monopoly over matters of religion and worldview in the radio.

Since this period, and in particular since World War II, some progress is apparent regarding tolerance. In part this was due to the increasing tempo of secularization in society, but not least also to the steadfastness of the freethinkers in this period. Increasingly few people are content with an antiquated ideology that offers inadequate solutions to contemporary problems because it originated in another epoch and under another social order. In a spiritual and moral sense, the state churches currently have a weak hold over the population: only 20 percent of those registered as members are actively involved in the churches; in the towns this can sink to as low as 2 percent.

Out of a population of seven million, eight hundred thousand registered as nonmembers of any confession (church) in the last census. This fragile demographic situation could not stand in more transparent contrast to the

enormous financial means still available to the churches because of their historical symbiosis with the state, which allows religious bodies to maintain a bureaucratic apparatus far beyond their actual importance in society. Only in the Cantons of Geneva and Neuchatel, which maintain separation of church and state, are the churches obliged to keep their workforce to realistic levels as they do not receive tax revenue.

Irrespective of economic perceptions, the Christian churches still maintain that they are custodians of an absolute truth—just as members of other religions insist that this lies with *them*—and that they must fulfill a higher purpose (albeit one that they have given themselves). This anachronistic and monopolistic attitude, common to Christian state churches, free church groups, and fundamentalist groups of various religions, continues to manifest itself in the form of religious-political activities. It is particularly visible in special interest lobbying in public affairs. Examples include recent debates on tax reform, during which religious bodies lobbied for state support of particular denominations based on their "historical entitlement"; constitutional reform, in connection with which churches lobbied to protect the role of a state church and the formal acknowledgment of God in the constitution; and in educational issues including state control of religious education, church access to schools, and influence over curricula.

The Swiss Freethinkers (Freidenker-Vereinigung der Schweiz, FVS) offer an alternative for those who want nothing to do with organized religion and prefer to embrace the values of HUMANISM and SECULARISM. A science-based empirical worldview replaces religious speculation. The criteria for truth are held to be insight, experience, and common sense. But the FVS is fully aware that there are still people who believe they require the crutches of religion and a belief in an all-powerful, benevolent mentor. For this reason, the FVS demands that its interventions in public life display a tolerance for all worldviews, whether founded on a religious or on a scientific basis. Naturally the FVS aims beyond this—article 2 of its statutes defines the following goals: "The FVS promotes free and critical thinking on the basis of a humanistic and science-oriented worldview and ethics—not bound to any articles of religion or to political ideology. It strives to assert these values in state and society. It intervenes for the freedom of faith, of opinion, and of expression. It strives towards the equality of all scientific groups and their independence from the state (separation of church and state). It offers, in accordance with the current needs, social and cultural services, in particular, alternatives to religious services. It advocates humane living conditions and supports effective measures to protect the environment."

To realize this article, the Swiss Freethinkers work toward a strict separation of churches from all state institutions, including schools and the army. They intervene in the mass media for an appropriate consideration of freethought concerns, equality of men and women in economic and legal matters, the reform and extension of educational establishments from preschool to the universities, and meaningful support for countries in need of aid. The FVS intervenes nationally and internationally in matters that concern humanists or on behalf of humanists or sister organizations. However FVS membership is aging demographically, and is underrepresented in the Swiss population. In 2005 the FVS hired a general secretary to combat these problems, to increase its profile within Switzerland and the effectiveness of its interventions.

The work of the Enlightenment continues (see ENLIGHTENMENT, UNBELIEF DURING THE) for the freethinkers in Switzerland and in the rest of the world, against forms of superstition and against religious and irrational perceptions. Opposition to freethought has however diffused with the development of a free market for salvation, from state churches to diverse orthodox, fundamentalist, or state church groups, and even New Age esoteric groups. Recent changes in the FVS should help it regain lost momentum as an alternative to such groups, to become again an energetic movement for secularism and humanism.

SYMES, JOSEPH (1841–1906), Australian lecturer, journalist, pamphleteer, and controversialist. Joseph Symes was born in Portland, Dorset, England, on January 29, 1841, a birthday he was proud to share with one of his heroes, Thomas PAINE. Symes's childhood was happy; he grew up a pious Wesleyan. At twenty-three he entered the Wesleyan College in Richmond, Surrey, to train as a minister. But he veered increasingly away from religion, stimulated by the reports of death and suffering during the Franco-Prussian War, the pope's declaration of infallibility, and the condition of the poor in England. Symes's passage away from religion was tortuous and exhausting, but by 1875 he was a convinced freethinker (see FREETHOUGHT).

In 1876 Symes began contributing to the *NATIONAL REFORMER*, the paper run by Charles BRADLAUGH. In the same year he was appointed the NATIONAL SECULAR SOCIETY's official lecturer at Tyneside. Symes took an active role in the National Secular Society for the next seven years, most notably in 1877, when he was an important figure in securing Bradlaugh's reelection as president of the society against a major challenge to Bradlaugh's leadership by opponents of his favorable views on birth control.

Symes worked tirelessly for the freethought movement, although he was disappointed not to be offered the editorship of the *FREETHINKER* during G. W. FOOTE's imprisonment for BLASPHEMY in 1883. It may have been with some relief that Bradlaugh passed on to Symes the request from Australian freethinkers that a lecturer be sent out to help their budding movement. Symes left England on the *Lusitania* on December 23, 1883,

arriving in Melbourne in the middle of the following February, whereupon he launched immediately into a career of freethought activism.

During the next twenty years, Symes established himself as the leading personality in Australian freethought through the Australian Secular Association (ASA), serving for many years as president of its Victoria branch. Symes excelled as a lecturer, journalist, pamphleteer, and controversialist. His main vehicle was the newspaper the *Liberator*, which he was instrumental in founding in 1884 and which ran until 1904. Symes was also more than competent as an astronomer and zoologist, although the Melbourne clubs dedicated to the advance of those disciplines took care to reject his applications for membership.

As a leading figure in Australian freethought, it was inevitable that Symes would attract opposition from within the movement as from without. In 1888 the ASA underwent a damaging split. Ostensibly the split was between pro- and anti-Symes factions, though the historical research of Nigel Sinnott reveals that deeper splits underlay and predated Symes's arrival in Australia. Prominent among Symes's opponents were radical anarchists (see ANARCHISM AND UNBELIEF) who thought their brand of revolution had outgrown SECULARISM. The next few years were taken up with feuding between the estranged factions of the freethought movement. As if this was not enough, in 1892 Matilda Symes, his wife of twenty-one years, died. The following year Symes married his publisher, Agnes T. Wilson.

Most disastrous for the freethought movement was the depression of the 1890s, which had the effect of scattering workingmen around the country in search of employment. Symes courageously continued lecturing and publishing the *Liberator*. In December 1899, he was attacked in broad daylight shortly before he was to give a lecture denouncing the Catholic Church's anti-Semitism, which had reached a toxic peak during the trial of Alfred Dreyfus in France. Symes's hearing was permanently impaired after the beating he received.

In 1906 the Symes family journeyed back to England, which Joseph had not seen for twenty years. The National Secular Society gave him a hero's welcome, with a series of dinners and presentations. Energized by his return to England, Symes undertook a grueling lecture tour of the country, despite the heart disease from which he had suffered for several years. While lecturing in his youthful stamping ground of Tyneside, he caught pneumonia and died suddenly on December 29, 1906, aged sixty-five. Among Symes's pamphlets included titles such as *Philosophic Atheism, Christianity and Slavery*, and *If Jesus Came to Melbourne*.

BILL COOKE

TAOISM, UNBELIEF WITHIN. See **CHINA, UNBELIEF IN.**

TAYLOR, ROBERT (1784–1844), English FREETHOUGHT pioneer, writer, and eccentric. Robert Taylor was born on August 18, 1784, in Edmonton, now a northern suburb of London. He was the second son of John Taylor, a wealthy ironmonger, and Elizabeth Jasper. Though Robert's father died when he was only seven years old, the family was well provided for and he received a good education. Notwithstanding his clear poetic ability, he learned medicine, eventually becoming a surgeon.

During his medical training, Taylor was converted to a zealous form of evangelical religion on behalf of which he abandoned his medical career. In January 1813 he graduated and took holy orders. While serving as a curate in Midhurst, Sussex, in 1818, Taylor befriended Henry Ayling, a local tradesman whose fine library included some of the works of Thomas PAINE. Taylor soon plunged into a period of doubt, which led to his being shunned by his parishioners. Though he formally recanted his heresies (see HERESY), Taylor was ostracized by his family. Also the church hierarchy made clear that he had no future as a clergyman. Taylor's recantation was short-lived; for the next ten years, he drifted around the British Isles, usually penniless, in search of employment. In 1824, after escaping violent persecution in Dublin, Taylor returned to London, where he set up the Christian Evidence Society, with the aim of proving that that was no evidence for the Christian truth claims. Ironically, there remains a Christian Evidence Society to this day, but with opposite aims.

The eloquence of Taylor's heretical lectures—and his habit of giving them in full clerical regalia—was an increasing scandal for the church authorities, which determined to bring him down. On trumped up charges of BLASPHEMY, Taylor was imprisoned twice: for a year in February 1828, and for eighteen months during 1831–32. During his first imprisonment, Taylor wrote *The Diegesis* (1829), which explored the origins, evidences, and early history of Christianity.

Taylor's intellectual legacy is mixed. He was an early advocate of the "myth theory" of Jesus (see JESUS, HISTORICITY OF), which is of interest only to historians of ideas, but significant strands of his BIBLICAL CRITICISM remain valid today. He argued forcefully, for instance, that the apostolic authorship of the gospels makes no historical sense. Few serious biblical historians would question that today.

Taylor also wrote a weekly letter to the *Lion*, a periodical his friend Richard CARLILE began on his behalf. These

letters were later published as *The Devil's Pulpit* (1830). By this time, Taylor had been branded "the Devil's Chaplain" by his religious persecutors. Taylor's second term of imprisonment was harsher than the first. His health broke down under the strain, and he wrote nothing. Soon after his release he married a wealthy supporter, moved to France, and practiced medicine, taking no further part in organized freethought. He died on June 5, 1844.

BILL COOKE

TELLER, WOOLSEY (1890–1954), American atheist writer, lecturer, and debater. Born on March 22, 1890, in Brooklyn, New York, Woolsey Teller was attracted to FREETHOUGHT in his teens by its flagship journal, *THE TRUTH SEEKER*. In the 1920s he joined the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM, founded by future *Truth Seeker* editor Charles L. SMITH and others. This organization, often referred to as "the 4As," received broad press coverage for an ambitious, ultimately sterile plan to organize student atheist groups. Teller was an officer of the organization for the rest of his life, editing its newsletter the *4A Bulletin* (after 1947, the *Atheist*). In 1936 Teller took up freethought work full-time, joining *The Truth Seeker* as associate editor.

Reputedly a fearless lecturer and debater, Teller specialized in confronting hostile religious audiences. In his regular *Truth Seeker* column, "Rougher Notes," he revealed a flinty, idiosyncratic RATIONALISM. For him, both evolution and the profligate wastefulness of the cosmos proved that God does not exist, a cosmological view not unlike Bertrand RUSSELL's. More controversially, Teller held that advances in science and technology made philosophy, psychology, the social sciences, and even mathematics irrelevant. Since evolution is a ruthless struggle for survival, altruism cannot have arisen among human beings; people who believe they act selflessly are deluded, unaware that they act only to satisfy themselves. Finally, Teller espoused EUGENICS and a toxic "scientific" racism. (Teller is considered partly responsible for *The Truth Seeker*'s sharp racist turn under Smith's editorship, which began in 1937; Smith and successor James Hervey JOHNSON championed racism and a venomous anti-Semitism largely absent in Teller.)

Teller wrote one book, *The Atheism of Astronomy* (1938), a refutation of the Design Argument for the existence of God (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). A 1945 anthology of Teller's *Truth Seeker* columns, *Essays of an Atheist*, is better known.

Little is known of Teller's personal life. The dedication of *Essays of an Atheist* suggests that he had three children. Woolsey Teller died of a stroke in New York on March 11, 1954, aged sixty-three.

THEOSOPHY. Theosophy is a mystical movement teaching that the universe evolves through countless cycles. The present world is one of several manifestations that hosted thousands of cyclic revolutions of life, from the least to most advanced. Human beings are souls that undergo numerous reincarnations through various stages of evolution. Certain advanced souls with godlike qualities, called "masters," watch over and assist humanity. Theosophy teaches that matter and spirit are variations of the same reality. It posits an ethic of care for the world and for fellow human beings. Theosophy was rooted in late nineteenth-century religious and cultural life in Europe and the United States, and provided inspiration and intellectual grounding for many of the popular mystical movements that followed it.

Theosophy, which means "divine wisdom," was the term adopted by a small group of middle-class professionals and intellectuals who met in New York City in the 1870s to describe their search for commonalities in all world religions, for explanations of Spiritualism and paranormal phenomena, and for an ethical formula to unite all people. Their Theosophical Society was founded in 1875 by Helena Petrovna Blavatsky, a Russian immigrant, and Henry Steel Olcott, an American journalist. Blavatsky claimed to communicate with masters through paranormal means. Her acquaintances claimed to have witnessed her performing supernatural feats like precipitating objects out of thin air. Blavatsky traveled extensively in Europe and Asia before she came to New York. She read widely in the literature, religion, and philosophies of many cultures. In 1879 she and Olcott moved to southern India, where they established a headquarters at Adyar, near Chennai (formerly Madras). They cultivated a network of Anglo-British writers and Indians influenced by the Hindu renaissance of the era. They encouraged the founding of local Theosophical lodges, mirroring a social form found in

Freemasonry. Many early Theosophists were Freemasons who saw no contradiction between the symbols and secret teachings of Freemasonry and those of Theosophy. Blavatsky and Olcott fostered publishing projects that included periodicals and books. Blavatsky borrowed heavily from Hindu, Buddhist, and other Asian sources to support her philosophy of evolutionary advance. Theosophy was one of the first Western philosophical/religious movements to embrace Asian perspectives.

In 1885 Blavatsky became embroiled in a controversy. Critics accused her of forging letters supposedly from the masters, then claiming they had appeared through paranormal means. Because of the negative publicity that resulted, Blavatsky moved to Europe. She died in London.

One prominent British Theosophist influenced by Blavatsky was Annie Wood BESANT, a well-known writer, social reformer, and one of the leading freethinkers of the era. After converting to Theosophy, Besant quickly rose in Theosophical leadership. Eventually she led the Theosophical Society in Europe, and later from India, advocating Indian independence. Irish immigrant and attorney William Q. Judge led American Theosophists to declare their independence from the rest of the Theosophical Society in 1895 due to disagreements between Judge and Besant. Judge's successor, Katherine Tingley, established a Theosophical community at Point Loma, near San Diego, California. The organization descended from this community, the Theosophical Society (Pasadena), is now headquartered in Altadena, California. Theosophists in the United States loyal to Besant, the Theosophical Society in America, are headquartered in Wheaton, Illinois. Much of the disagreement between these two branches of Theosophy centers on the question of authority: Which tradition preserved Blavatsky's teachings most authentically and continued to receive guidance from the masters? The Theosophical Society (Pasadena) claims that it remained true to Blavatsky, through Judge and his successors, charging that the tradition of Besant had added doctrines supplementary to Blavatsky's teachings. The Theosophical Society in America looks to the extensions of Theosophical doctrine that Besant and others in her line advocated as being true to Blavatsky, if not always articulated exactly in Blavatsky's writings. Both of these major branches, and several smaller ones, publish Theosophical magazines and books.

Theosophists' numbers in Europe, India, the United States, and Australasia are greatly diminished from their heyday between 1890 and 1930, but many spiritual seekers who eventually gravitated to the New Age and other twentieth-century new religious movements read Theosophical literature during their spiritual pilgrimages.

W. MICHAEL ASHCRAFT

THUCYDIDES (460/455–ca. 400 BCE). Ancient Greek historian and humanist. Born between 460 and 455 BCE, Thucydides served as general in the Athenian forces against Sparta in 424, and died in the early fourth century. Exiled from Athens after a defeat in 424, he spent the rest of his life working on his *History of the Peloponnesian War.* After an overview of prehistory, this book tells the story of the war between Athens and Sparta and their respective allies through 411, covering the causes of war, the plague years in Athens, the effects of civil war, and a number of debates that set ethical points of view against pragmatic ones.

Thucydides was not an avowed atheist (see ATHEISM), but by comparison with his contemporaries his writing is strikingly godless. Before his time, the great writers about human events were poets such as Homer, whose epics are laced with episodes in which the gods take a hand in directing or undermining human action. Throughout his works Thucydides draws attention to the difference between his work and the poets: they told pleasant stories, he tells the truth. His older contemporary Herodotus, who wrote up the Persian Wars, included many tales involving divine intervention, and expresses none of the SKEPTICISM we find in Thucydides. Thucydides worked from an empirical theory of human behavior that furnishes explanations for the sorts of events that pious people attributed to the gods. He was the first European to write of human events making no reference to divine intervention. His is thus a kind of atheism by displacement; naturalistic explanation (see NATURALISM) leaves no role for the gods, who quietly drop altogether out of the human story.

Thucydides' prehistory (known as his "Archaeology") explains the origins of society in human terms, based on traditional reports, analogies with primitive peoples, and inferences from buried artifacts. His explanation of war

distinguishes between the official explanation—that the Athenian empire violated justice—and the true one—that the Spartans were frightened by the growth of Athenian power. His account of the plague points out that religious observance made no difference to survival and makes light of oracles and prophecies. He displayed a rationalist contempt for oracles, though he once grudgingly agreed that one oracle turned out right.

Thucydides was not alone in his RATIONALISM. Others challenged the oracles and proposed naturalistic explanations for the origins of culture. Thucydides, however, is unique for the scope of his work and the pointed clarity with which he rejects the supernatural.

In addition to being a rationalist, Thucydides was a realist in holding that human actions are rarely motivated by religious or ethical concerns. Instead, he offered an account of human action in which fear, ambition (or love of glory), and greed are dominant. Religious concerns do not bring people to war or to peace, or even strengthen people's willingness to abide by their oaths.

His theory of human nature is flexible, however, since Thucydides believes that people's behavior is affected by circumstance; extreme conditions such as the plague undermine the veneer of ethical civilization that is celebrated by Pericles, a point Thucydides underlines by reporting Pericles' encomium to the virtues of Athens just before he tells how Athenian behavior declined during the plague. But as Thucydides sees it, the nastiest side of human behavior is brought out by civil war: "War is a violent teacher . . . it gives most people impulses that are as bad as their situation when it takes away the easy supply of what they need for daily life." The implication is clear: peace, health, and prosperity bring out the best in us, while religion is irrelevant.

PAUL WOODRUFF

TINDAL, MATTHEW (1657–1733), English deist writer. Matthew Tindal, who came from a High Church background, attended Lincoln College, Oxford, where he studied under George Hickes, who was to become one of his most hostile opponents. Moving to Exeter College, where he received his BA in 1676, Tindal became a law fellow of All Souls in 1678 and a doctor of law in 1685. The lawyer's approach is apparent in his writings, and he retained his law fellowship for the rest of his long and mostly uneventful life.

One major event was Tindal's conversion to Roman Catholicism. This was brought about, around 1685, by a "popish emissary" employed by James II at Oxford. Tindal's detractors have accused him of opportunism—he hoped, it was said, to become head of his college—but this seems unlikely since he publicly renounced Catholicism in 1687 or early in 1688 while James was still in power. His conversion to, and then away from, Catholicism was no doubt a factor in his move to FREETHOUGHT. Another, more general factor was the social disorders of the time, for which religious intolerance was largely responsible.

Early Freethought. Opposition to religious intolerance and sympathy for freethought and for social order are evident in Tindal's two anti-Trinitarian pamphlets, *A Letter to the Reverend the Clergy of Both Universities* (1694) and *Reflections on the Trinity* (1695), as well as in his *Essay concerning the Power of the Magistrate, and the Rights of Mankind, in Matters of Religion* (1697), which was approved by John LOCKE and advocated toleration along Lockean lines. Tindal also wrote *A Letter to a Member of Parliament, Shewing That a Restraint of the Press Is Inconsistent with the Protestant Religion, and Dangerous to the Liberties of the Nation* (1698), which was republished in shortened form six years later as *Reasons against Restraining the Press.*

In 1706 Tindal issued his first major work, *The Rights of the Christian Church Asserted, against the Romish and All Other Priests Who Claim an Independent Power over It*, which, he is supposed to have said, would make the clergy "mad." It did, provoking about two dozen replies and drawing strong criticism from Jonathan Swift and George Berkeley, among others. A more accurate but less strategic title would have been "The Rights of the Christian Laity," for the book defends liberty of conscience and worship against clerical claims to authority in these areas. The clergy, Tindal argues, can have no powers independent of the civil authority, which is obliged to protect the religious freedom of the laity, "so long as they do nothing prejudicial to the Civil Society." Tindal issued a *Defence of the Rights* in 1707, which, together with the *Rights*, was burned in 1710 by the common hangman by order of the House of Commons.

Between 1708 and 1713 Tindal published pamphlets relating to the *Rights* and the controversy about Sacheverell's Jacobitism (loyalty to the exiled Stuarts). The most entertaining is *A New Catechism* (1710) and the most substantial is *The Nation Vindicated*, part 2 (1712); here he defended previous freethinking works and lashed out at such enemies as Jonathan Swift, "this Reverend Buffoon"; Henry Dodwell, "this muddy-headed Irishman"; and his old teacher, "the Godly Dr. Hickes." Like Anthony COLLINS, Charles Blount, John TOLAND, John Trenchard, and Peter ANNET, he defended DETERMINISM—a position, according to Leslie STEPHEN and Ernest Mossner, that English freethinkers were supposed to oppose.

From 1713 to 1729 Tindal wrote fifteen more pamphlets, almost all of them on political topics. His next freethought work, *An Address to the Inhabitants of London and Westminster; In Relation to a Pastoral Letter . . . by the Bishop of London, Occasion'd by Some Late Writings in Favour of Infidelity* (1729), is also a defense of fellow freethinkers, notably Collins and Thomas WOOLSTON.

The Deist's Bible. The "grand work" upon which Tindal's fame mainly rests was issued in 1730 when he was more than seventy-two years old. This is *Christianity*

as Old as Creation: or, the Gospel, a Republication of the Religion of Nature, the classic statement of constructive DEISM, often described as "the deist's Bible." The last part of his title was borrowed from a sermon by Bishop Sherlock, a practice that nicely illustrates his exploitation of the liberal or unguarded pronouncements of clergymen. Tindal drew out and synthesized the tendency toward natural and moral religion among liberal and Low Church writers such as Tillotson and Clarke. The book made the clergy even angrier than his first major work, eliciting well over a hundred replies. Although separated by almost twenty-five years, Tindal's two major works are closely connected. As the *Rights* opposed the clergy's having power independent of civil authority, so *Christianity as Old as Creation* denies to revealed religion any authority independent of reason; and as the first pretension leads to social and religious disorder, so, Tindal argued, the second will "weaken the force of the Religion of Reason and Nature, strike at all religion; and [he adds] there can't be Two Independent Rules for the Government of human Actions."

As with the *Rights*, Tindal intended to issue a second volume of *Christianity*. However, none appeared, although he published a *Second Address* (1730) which contains a defense of *Christianity* against an attack by Daniel Waterland; and in the British Library there is a fragment of the introduction to volume two, which contains answers to "Mr. Jackson, Mr. Foster, and Dr. Conybeare; the First a Low Churchman, the other a Dissenter, and the Third a High Churchman." It is often said that Edmund Gibson, bishop of London, suppressed the second volume, but there is good reason to doubt this.

Tindal was accused of being an immoral man, "a noted Debauchee and a man of very pernicious Principles," as Thomas Hearne put it. No doubt criticism of his moral character was designed partly to bring his principles into disrepute; for showing that the man who virtually reduced religion to morality was himself immoral would certainly help the enemies of deism. However, there is probably some truth in the accusations, for in a private memoir of Collins, Lord Egmont says that Collins "used to say my friend Tyndal [*sic*] is a rogue and a disgrace to us, for he is not honest or virtuous. . . ."

Deist or Atheist? Even more difficult is the question of Tindal's actual theoretical position. Was he a deist, as most commentators hold, or an atheist, as some of his critics claimed? Although there is little suggestion of ATHEISM in his writings, we have two similar but apparently independent stories about how Tindal argued against the existence of God: one is in the *Religious, Rational and Moral Conduct of Matthew Tindal* (1735), and the other, more circumstantial account is given by Lord Egmont in his diary (November 1735). In brief, Tindal argued "that space was infinite and eternal, and these were attributes commonly given to God; either therefore space is the Christian's God, or there are two Gods infinite and eternal, which at the bottom is as good as to say there is no God at all."

Tindal's assertion appears to be a garbled and materialistic version of the (Spinozistic) argument for pantheistic monism, which, in short, is this: there can be only one, most perfect, necessary being; for if there were two, they would cancel each other's perfection and necessity. Hence the one perfect and necessary being must embrace everything within itself, including extension. It is likely that Collins and Tindal—and perhaps also Toland's pantheistic societies—grounded their pantheistic MATERIALISM in this way. As the writer of the *Religious . . . Conduct of Tindal* put it: "Their God is at last the Universe; or, as they sometime express themselves, one only extended or material Substance differently modified." However, without additional evidence, it is difficult to decide whether Tindal accepted this atheistic line of argument (a line of argument that contains resonances of his opposition to two independent powers in the *Rights* and *Christianity*).

Tindal died on August 16, 1733, uttering blasphemies "scarce fit to be repeated," according to a witness, and "as proud of dying hard as ever he was to be reputed a Top Free Thinker."

DAVID BERMAN

TOLAND, JOHN (1670–1722), Irish freethinker. Originally named Janus Junius Toland, John Toland was born in County Donegal in the north of Ireland. "Educated from the cradle in the grossest superstition and idolatry," he says in the preface to his *Christianity Not Mysterious* (1696), he threw off Roman Catholicism at age fifteen by "his own reason and such as made use of theirs." From his conversion away from the faith in 1685—a most imprudent time, given the known religious predilections of James II—Toland's life is marked by considerable travel and intellectual development.

Education. Toland attended the University of Glasgow from 1687 to 1690, and aligned himself with the Presbyterians. His original conversion was probably to Presbyterianism and not to Anglicanism as some claim, since in his 1697 *Apology* he speaks of "the Dissenter's worship [gaining] extraordinarily upon his affections,

just as he was newly delivered from [popery]." From Glasgow he went to Edinburgh, and received an MA in 1690. He then moved to London, where he so impressed the Dissenters that they sent him to the University of Leyden to "perfect his education," as his biographer Pierre Desmaizeaux puts it. In Holland he studied under Spanheim and Leclerc and became a Latitudinarian—that is, a tolerant, rationalistic, liberal Christian.

Benjamin Furley, John LOCKE's Dutch correspondent, described Toland in 1693 as "a freespirited, ingenious man." This characteristic freespiritedness brought with it the besetting practical problem of his life; for, continues Furley, "having cast off the yoke of spiritual authority . . . has rendered it somewhat difficult for him to find a way of subsistence in the world." Having neither family fortune, as had Lord SHAFTESBURY and Anthony COLLINS, nor an Oxford fellowship, as Matthew TINDAL had, Toland was thrown upon the generosity of aristocratic patrons, such as the Duke of Newcastle, Prince Eugene of Savoy, Lords Shaftesbury and Molesworth, and the Earl of Oxford, who employed him as an editor, political pamphleteer, biographer, and probably a "general" spy. As his background was obscure, his prospects were generally uncertain, and he was forced to live by his pen. That he was an incessant writer and controversialist is amply shown in Giancarlo Carabelli's two-volume bibliography of his writings and replies to them; it runs to more than five hundred pages and lists nearly two hundred works by or attributed to him.

Toland is perhaps the first professional freethinker. Eliminating prejudice and religious intolerance was, by his own account, one of the main aims of his life. Most of his writings, and the best of them, are directed against established religion—not, of course, that he ever avowed this. Officially, he claimed, as in *Vindicius Liberius* (1702), to be a loyal member of the Church of England, anxious only to eliminate abuses of religion. However, critics such as Samuel Clarke saw him, rightly, as one of Christianity's most powerful enemies.

Christianity Not Mysterious. After leaving Holland, Toland spent some time in Oxford using its library facilities. From there he moved to London, where early in 1696 he published his most influential work, *Christianity Not Mysterious*. This short and forceful book made him notorious: according to some, it also began the so-called deist debate (see DEISM). Like nearly all of Toland's books, its subtitle is informative: *A Treatise Shewing, That There Is Nothing in the Gospel Contrary to Reason, Nor Above It: and That No Christian Doctrine Can Be Properly Called a Mystery*. Drawing especially on Locke's theories of meaning and nominal essence, Toland argued that since mysteries such as the Holy Trinity do not stand for clear ideas, Christianity must either employ meaningless doctrines or else be nonmysterious; for assenting to doctrines of which we have no clear ideas is like trying to believe in Blictri, a traditional nonsense word.

Early in 1697 Toland revisited Ireland, where in a short time he had "raised against him the clamour of all parties," as we are told by Locke's Dublin friend, William Molyneux; the clergy, especially, were "alarmed to a mighty degree against him." *Christianity Not Mysterious* was burned by the common hangman, and it was even moved by one member of the Irish House of Commons "that Mr. Toland himself should be burnt." Yet for all that, his book initiated the one great flowering of Irish philosophy, drawing creative replies from Peter Browne (whom Toland claimed to have made a bishop), Edward Synge, William King, and George Berkeley.

It is not clear why Toland returned to Ireland. There is some evidence that he expected a political appointment. Possibly he also wished (notwithstanding his protests in the *Apology*) to encourage a return to the tolerant religion of the ancient Irish, the "Western Latitudinarians," as he described them in *Nazarenus* (1718). He boasted, according to Browne, that he would become "the head of a sect." In any case, he was forced to flee to England, where he published the *Apology*, which deals with his reception in Dublin and contains most of the meager information we have on his early life.

Toland's concern for civil liberty, another professed aim, begins to appear in his editions of John Milton (1698), James Harrington (1700), and in his *Anglia Libera* (1701), a book that encouraged the British government to send him with a delegation to Hanover, where he is said to have gained the esteem of the future ruling family of England. In 1702 he revisited Hanover and also traveled to Berlin, where he engaged in philosophical discussions with the queen of Prussia, to whom he addressed his *Letters to Serena* (1704).

The RATIONALISM of *Christianity Not Mysterious* is continued in the *Letters*; but whereas the first may be described as deistic, the *Letters* are pantheistic (see PANTHEISM AND UNBELIEF). Once again this is not Toland's avowed view. In fact, in the penultimate section of Letter 5, "Motion Essential to Matter," he expressly repudiates Baruch SPINOZA's pantheism and affirms that there exists an immaterial presiding intelligence responsible for the formation of plants and animals. But, as F. A. Lange has suggested, this caveat should be seen as an application of the esoteric/exoteric (private/public) distinction, a subject Toland discusses at length in *Tetradymus* (1720), where he claims that the distinction is "as much now in use as ever; tho' the distinction is not so openly and professedly approved as among the Ancients."

That Toland was a pantheist in 1704, and hence that the penultimate section was designed for exoteric use, is borne out by the following considerations: (1) In *Socinianism Truly Stated*, a pamphlet printed in 1705, Toland signs himself "a Pantheist" (the first recorded use of the term in English). (2) The logical tendency of Letter 5 is toward pantheistic materialism, since allowing motion to be essential to matter undermines the most compelling reason for positing a transcendent cause of the world. (3) In the exuberant poem *Clito*, first printed in 1700, Toland

explicitly develops and takes seriously a pantheistic theory. Moreover, his statements on key doctrines in the *Letters to Serena* are basically the same as those in the poem and in his 1720 *Pantheisticon*.

Letter 3 is a "History of the Soul's Immortality," in which Toland argues that the doctrine was invented by Egyptian priests for their own selfish interests. The drift of the letter is clearly irreligious, but once again in the penultimate section Toland issues a religious caveat. His strategy here bears comparing with that of David HUME, who, in the final paragraph of his essays "The Immortality of the Soul" and "Of Miracles," issues a similarly crude religious caveat. A "Bouncing compliment," as Toland observes in *Tetradymus*, "saves all."

In 1707–1709 Toland visited Prague and then the Hague, where he published his *Adeisidaemon* (directed against superstition) and *Origines Judaicae*, in which he suggests that Strabo was a sounder historian of the Jews than Moses. Gottfried LEIBNIZ commented critically on these works in letters to Toland, later to be printed in volume two of *A Collection of Several Pieces of Toland* (1726). In addition to writing numerous political pamphlets, such as "Reasons for Naturalizing the Jews" (1714) and "Political Anatomy of Great Britain" (1717), which continue his plea for religious toleration, Toland projected a number of "grand works." Among them was a history of the Druids, which appeared in a modest form in his posthumous *Collection*.

Later Work. *Nazarenus* is Toland's most significant contribution to biblical scholarship. It looks back to a controversy started by his *Life of Milton* (1698), wherein he defended Milton's view that *Eikon Basilike* was not written by Charles I, as claimed, but was a pious fraud composed by Bishop John Gauden. Toland then suggested that this recent forgery helped to explain the acceptance in earlier times of "suppositious pieces under the name of Christ and his apostles," a thesis he defended in *Amyntor* (1699), in which he lists more than seventy spurious gospels, Epistles, Acts, and so on. Toland said that he was not calling into question the canon of the New Testament; but few if any took this seriously. In *Nazarenus* he anticipates the so-called higher criticism in placing early Christianity firmly in a Jewish context. He argues that the first Christians—the Nazarenes, Ebionites—or, as he calls them, Jewish Christians—were obliged to keep the Levitical law, and that although true Christianity was perverted by the heathenism of the Gentile Christians (who were not meant to keep the law), it can be extensively reconstructed from the Gospel of Barnabas.

In 1720 Toland had *Pantheisticon*, his most exotic work, printed. It contains an explicit statement of pantheism and a liturgy that was taken to be a burlesque of the Christian liturgy. Whether there existed pantheistic societies that used this liturgy, as he suggests, is not known. It is generally agreed that his pantheism is closer to that of Giordano BRUNO (whose works he translated) than to that of Spinoza, who is criticized in the fourth essay in the *Letters to Serena*. In 1720 Toland also published *Tetradymas*, which, apart from the study of the esoteric/exoteric distinction, contains an essay on the murder of HYPATIA, a naturalistic account of the pillar of cloud and fire mentioned in Exodus, and a defense of *Nazarenus*.

Toland's impact on his generation was widespread and varied: few prominent writers of the time were not goaded by him. Many of his contemporaries affected a condescending attitude toward him, which was continued, unjustly, by Leslie STEPHEN in his influential *History of English Thought in the Eighteenth Century*. Other commentators rightly feel that, given Toland's undoubted powers, his intellectual contribution might have been more solid and sustained than it was. There is something swashbuckling about Toland's work: he is, as it were, an Irish adventurer in scholarship. His last years were bedeviled by financial worries; he lost money in the South Sea scheme, whose secret history he helped write. Yet he died on March 11, 1722, Desmaizeaux says, "without the least perturbation of mind," having a few days earlier written an epitaph that concludes: "If you would know more of him Search his Writings."

DAVID BERMAN

TOLSTOY, LEV NIKOLAYEVICH (1828–1910), Russian novelist. Lev Tolstoy is celebrated primarily for his two great novels, *War and Peace* (1866–69) and *Anna Karenina* (1873–76), both of which contain serious speculation about how a human life should be led and whether religion has any useful part in the process. But he also wrote a number of works dealing directly with this subject.

Tolstoy's religious education began in the orthodox, or, more accurately, Orthodox way. He attended church with his family and absorbed all the practices and attitudes of the Russian Orthodox Church. All went smoothly enough until one day, when he was ten, an older boy announced to Tolstoy and his brothers that at school the older boy and his friends had made a discovery: God did not exist and everything they were being taught was untrue. It took Tolstoy a year or two to absorb this revelation, but he gradually shook off the trammels of the church, and by the time he left Kazan University (in midcourse) at the age of eighteen, he had abandoned every last vestige of the religious message that had been implanted in him during those early years.

We know these details because they are set down at the beginning of his most important religious text, *A Confession* (1879–81), written immediately after *Anna Karenina*, the closing pages of which show him (in the person of Dmitry Levin) to be entering a period of spiritual crisis. This climacteric, which occurred when he had just attained the age of fifty, was a renewal of the spiritual despair that had swept over him one night in 1869, just after he turned forty, when a vision of death had murdered sleep for him, filling him with dread and an agonizing sense of mortality.

A Confession is a cyclic work, starting and ending in religious acceptance, though its end is very different from its beginning. The autobiographical story goes as follows: Having renounced all thoughts of God and the Church, the young Tolstoy launched himself into several careers—soldier, writer, estate manager,—finding success in all of them but lasting contentment in none. On the contrary, he plunged ever deeper into despair. Turning to the great thinkers and prophets, he found their ideas riddled with inconsistencies and fallacies. No one could provide him with an answer to his questions that would justify his continued existence or dispel his fear of death, and for months on end he contemplated suicide. From this nadir of human experience he struggled back to an acceptance of life, and eventually discovered a plan for living that would suffice, though without bringing him any kind of happiness, for his remaining three decades. It was essentially religious, but not mystical or ecclesiastical. In a sense this was the fulfillment of a dream he had had as a young cadet: nothing less than the creation of a new, practical Christianity that would preserve the old morality and preach love as the only basis for human behavior, without retaining the dogma, mystery, and hypocrisy that bedeviled religious observance in the modern world.

The religious code of Tolstoy's last years was a severe form of asceticism based on a theory of love and nonresistance to evil which had its origin in Christ's Sermon on the Mount (Matt. 5–7). His writings on pacifism became known to a wide international audience, of which Mahatma Ghandi was but the most celebrated member; his famous estate became a focus of pilgrimage. (Tolstoy's inability, in his personal life, to show indulgence toward those nearest to him—especially poor Sonya, his wife, who had to put up with idiosyncrasy, depression, bad temper, and intransigence—remains as a dark stain on his reputation, undermining his right to instruct humanity on how to live a good life).

In this last period Tolstoy no longer considered all religious teaching to be a lie, though he thought there was more truth among the Russian peasantry than in the whole of the Orthodox Church. (For disseminating ideas like this he was excommunicated in 1901.) He made a profound study of theology culminating in a series of long religious essays and even a retranslation of the gospels from the Greek in an abbreviated and harmonized form (1881–82). His religious pronouncements are solidly based on years of study, comparison, and contemplation.

One of the most important is the little-known *What Is Religion, and What Does Its Essence Consist Of?* (1902), a succinct statement (in fewer than twenty thousand words) of all that Tolstoy saw as good and bad on the subject. While acknowledging that preachers and officials have debased religion, he deplored the modern spirit of secularism, and rejected the idea that religion has been rendered obsolete. It has always figured in human thinking, he asserted, and remains as relevant now as it has always been. All the great religions contain an essential truth that explains life and directs human conduct. That truth can be simply stated. We inhabit infinity—anything less than infinity is unimaginable—and yet we are ourselves finite in our short lives and limited powers of comprehension. The link between the two states is provided by religion (*religare* means "to bind"), the function of which is defined with acuity: "True religion is that relationship, in accordance with reason and knowledge, which man establishes with the infinite world around him, and which binds his life to that infinity and guides his actions" (see RELIGION). After a lifetime of struggling with these ideas, and many years of study, thinking, worry, and vacillation, this concept remained Tolstoy's final pronouncement on the subject.

A. D. P. BRIGGS

TONGUES, SPEAKING IN. *Speaking in tongues* refers to vocalizations attributed to supernatural or natural causes, and usually unintelligible to the speaker or listener(s). The general phenomenon is usually denominated as *glossolalia*, while the speaking of known languages otherwise foreign to the speaker (*xenoglossia*) may be con-

sidered a subcategory. Unbelief in the supernatural character of glossolalia is found in both Christian and non-Christian sources.

Ancient Times. Although some have claimed to find glossolalia described in documents from Mari, a kingdom on the Euphrates River (ca. 2000 and 1500 BCE) in what is now Syria, there are no unequivocal references to glossolalia before Christianity. According to Acts 1–2, after the ascension of Christ the disciples in Jerusalem awaited the arrival of Holy Spirit Baptism, a miracle that endowed them with special powers that included the ability to speak in previously unknown foreign languages (*xenoglossia*), in order to carry out their Christian mission. Acts 2:13–15 notes that some people mistook this event for drunkenness, suggesting that at least some witnesses tried to offer a naturalistic explanation. But it is also said that many foreigners in the crowd recognized their own languages being spoken. According to 1 Corinthians 13:1, there are also angelic tongues that human beings may speak, though an interpreter is needed if such tongues are spoken in a congregation (1 Cor. 14:2–5, 27).

Between the New Testament and modern times, we encounter very few instances of glossolalia in Christianity. One example is attributed to Montanus, a second-century figure whom Eusebius, the famous church historian, describes as a heretic. Eusebius suggests that Montanus's glossolalia was not authentic, at least by orthodox standards. Augustine, the influential Christian theologian, argued that glossolalia was no longer part of the Christian experience. In his *Homily on the First Epistle of St. John*, Augustine even appeals to empirical evidence insofar as he notes that the laying on of hands does not result in glossolalia, and that, therefore, Christians must presume that it no longer occurs.

Modern Times. Aside from reported sporadic glossolalia among Mormons and Shakers, as well as other groups, the most prominent sustained glossolalists are found in Pentecostalism, a complex of movements that first developed in America beginning in the late nineteenth and early twentieth centuries. Pentecostalism in its classical form holds that speaking in tongues is the only or main evidence of Holy Spirit Baptism. For Pentecostals, the spiritual gifts or powers mentioned in the New Testament, including healing and prophecy, still exist and should be actively cultivated by modern Christians. In general Pentecostalism now is a major force in Christianity, and it includes famous evangelists such as Jimmy Swaggart and Benny Hinn.

Naturalistic explanations for modern glossolalia can be found already in the late nineteenth century, in the work of the famed Harvard psychologist William James, who commented on cases that the speakers attributed to spiritual phenomena. However, James concluded that the language being spoken was in fact some sort of garbled English. A professor of psychology at the University of Geneva, Théodore Flournoy, was probably the first to outline a naturalistic categorization of glossolalia, which he divided into (1) incoherent random utterances; (2) neologisms created by psychosis, among other conditions; and (3) foreign idioms otherwise claimed to be unknown to the speaker. Flournoy based part of his work on the famous case of Hélène Smith, who believed herself to be speaking in Martian. The psychologist Carl Jung also examined at least two cases of glossolalia, and concluded that speakers distorted and repeated certain phrases that were otherwise meaningless.

In general, naturalistic explanations for glossolalia offered prior to the 1960s were variants of a "pathological" model, which portrayed glossolalists as suffering from some dysfunction, individually or as part of an inferior social group. For example, the French psychologist Emíle Lombard posited a type of automatism induced by hypnosis. Dr. George Cutten, a Baptist minister and president of Colgate University, suggests in *Speaking with Tongues* (1927) that glossolalists generally had lower mental abilities. Other naturalistic theories came from ethnographic accounts, such as those claiming that some Asian shamans were actually imitating animal sounds.

Beginning in the 1960s there was a dramatic shift to sociolinguistic and functionalist explanations for glossolalia. The medical anthropologist E. Mansell Pattison, for instance, concluded that the Pentecostals he studied actually functioned well in society. William Samarin has shown in great detail that his sample of Pentecostal glossolalists were not speaking any sort of meaningful language, natural or supernatural. He noted, in particular, that there were regionalisms in glossolalia, something that would not be expected of angelic tongues. Samarin stressed both the learned and the creative aspects of speaking in tongues.

Although pathological naturalistic evaluations of glossolalia have been found among social scientists, it is among non-Pentecostal Christians that one finds the most hostile evaluations of glossolalia. Thus, Robert G. Gromacki, an ordained Baptist minister, says that "[s]atanic power must be regarded as a live option as to the source of the modern tongues movement." Gromacki also believes that natural processes can account for some glossolalia.

Conclusion. Glossolalia probably has many explanations, and it is useful to distinguish different types of unintelligible utterances. The majority of Pentecostal glossolalia that I have observed, as a former Pentecostal preacher and trained anthropologist, is probably due to sociolinguistic causes and is not otherwise a meaningful language. Glossolalists imitate practices that are valued within the Pentecostal group to which they are committed, and sometimes exhibit creativity as well as imitation. Since the tongue is a muscle susceptible to involuntary spasms, it is also reasonable to posit that some states of excitement, especially when accompanied by music, can result in the involuntary generation of sounds that

may be experienced as "possession." Otherwise, there is no evidence that glossolalia has any supernatural basis.

HECTOR AVALOS

TREATY OF TRIPOLI. This treaty of 1796–97 is officially entitled "Treaty of peace and friendship between the United States of America and the Bey and Subjects of Tripoli of Barbary." (Tripoli is part of what later became known as Libya.) It is of little importance as a treaty or legal document, having been superseded by another treaty only nine years later. It has, however, been cited frequently, sometimes carelessly, as evidence against the claim that the United States was founded as "a Christian nation." The relevant language in the treaty, written in 1796, probably by diplomat Joel BARLOW, is to be found in the eleventh article of the treaty, which reads in its entirety:

> **Article 11.** As the government of the United States of America is not in any sense founded on the Christian Religion,—as it has in itself no character of enmity against the laws, religion or tranquility of Musselmen,—and as the said States never have entered into any war or act of hostility against any Mehomitan nation, it is declared by the parties that no pretext arising from religious opinions shall ever produce an interruption of the harmony existing between the two countries.

Musselmen was a term of the time for Muslims; *Mehomitan* was similarly a term for Mohammedan or Muslim. The treaty was brokered between Tripoli and the United States in late 1796 (initially signed and agreed to by both sides on November 4) at the end of the second presidential term of George Washington. There is no evidence that Washington was personally involved with or aware of the famous article, and it is therefore not wise to attribute the key words to Washington, as some FREETHOUGHT activists have done—though those words were indeed a product of Washington's administration. Yet there is no reason to believe that he would not have agreed with the idea. One Washington biographer, Paul Boller, wrote that "[v]ery likely Washington shared Barlow's view, though there is no record of his opinion about the treaty."

Purpose. The treaty grew out of negotiations between the Bey, or ruler, of Tripoli and Barlow, who either wrote the text or was its translator into English. The treaty was intended by the Americans to protect American shipping interests and American seamen, then under serious attacks and threats of more from "Barbary pirates." The treaty specified that the United States was paying to the Bey money, watches, rings, cloth, and brocade, and would add specific future items such as "twelve thousand Spanish dollars" and "twenty five barrels tar," to secure the peace. The treaty was somewhat successful in the short term, but in the end US Navy and Marine forces had instead to win the peace through force. The reference to Tripoli in the famous first line of the US Marine Hymn, "From the Halls of Montezuma to the shores of Tripoli," refers to Marine participation in the war against the pirates of the Barbary States (1801–1805) during Thomas JEFFERSON's administration.

Controversy. There has been great controversy about the treaty, probably because of its explicit rejection of Christianity as the basis for the government of the United States. Though such controversy is not groundless, there is no serious basis for rejecting the treaty as solid, though secondary, evidence of the framers' intent to establish a secular, non-Christian government. The US Constitution, lacking as it does any affirmative reference to religion, is both necessary and sufficient evidence of that secular intent, but the treaty provides weighty additional evidence of it less than a decade after ratification of the Constitution.

Among the objections to the treaty as evidence of the non-Christian nature of the American government is the possible fact that the Arabic version of the treaty, the one that the Bey and his representatives agreed to, did not include Article 11. The surviving Arabic version has in place of Article 11 a page of what can be best described as a diplomatic cover letter with some flamboyant Arabic gibberish, and no one seems to know why. Someone other than Barlow could well have substituted an Arabic page, perhaps even by accident at the time, or at some later time between the date it was written and the date the nontreaty page was discovered (in 1930). Barlow was very likely by 1796 a deist (see DEISM), though he had served earlier as a military chaplain, so one other possible (but unlikely) explanation is that Barlow wrote Article 11 and included it only in the English version—and therefore only for domestic consumption. If so, his motives may be suspect, but the Barlow translation with its famous clause is the one sent to the US Senate for ratification by President John Adams (the process of getting the treaty language approved and the documents back to America took several months). And it is the Barlow translation that is and always has been recorded as the official version of the treaty in American diplomatic archives and publications.

Another occasional objection is that the treaty was later superseded, after Jefferson's war with the Barbary pirates, by a new treaty that contained no such language. Indeed, some later treaties with nations such as Russia or Great Britain included flowery ceremonial language about the Christian Trinity. But it must be noted that the later treaties with such language were with nations that were at the time officially Christian nations—and none of the later treaties reversed, or even implied a reversal of, the declaration in the 1796–97 treaty that the US government is not founded on the Christian religion. The current importance of the treaty with its famous Article 11 language is neither formal nor legal but historical. The "not in any sense founded on the Christian Religion" wording merely reinforces what the US Constitution had recently established—a secular basis for government.

Adams, inaugurated in March, sent the treaty to the Senate in late May 1797. Copies were printed for the Senate and the committee considering it. The committee reported favorably to the Senate a week later and on June 7, 1797, the Senate voted to ratify, with all twenty-three senators present recorded in favor: "Bingham, Bloodworth, Blount, Bradford, Brown, Cocke, Foster, Goodhue, Hillhouse, Howard, Langdon, Latimer, Laurance, Livermore, Martin, Paine [not Thomas PAINE], Read, Rutherfurd, Sedgwick, Stockton, Tattnall, Tichenor, and Tracy." (The Senate, like the nation, was smaller then; also a few senators were not present.) For only the third time in the history of the Senate, a recorded vote was requested and approved despite unanimity, which is why we know the names of every senator voting in favor. There were up to that point 339 recorded Senate votes (out of thousands of votes in Senate history by then), but 336 were on matters where the Senate was divided and where, presumably, those in the minority wanted their own or their opponents' votes shown on the historical record. There is no record of any debate or dissension in the Senate on the treaty.

President Adams signed the treaty and proclaimed it to the nation on June 10, 1797. His message of transmission was a bit unusual:

> Now be it known, That I John Adams, President of the United States of America, having seen and considered the said Treaty do, by and with the advice and consent of the Senate, accept, ratify, and confirm the same, and every clause and article thereof. And to the End that the said Treaty may be observed and performed with good Faith on the part of the United States, I have ordered the premises to be made public; And I do hereby enjoin and require all persons bearing office civil or military within the United States, and all other citizens or inhabitants thereof, faithfully to observe and fulfil [*sic*] the said Treaty and every clause and article thereof.

The wording of the treaty, including its now famous Article 11, as well as Adams's proclamation, was printed in newspapers of the day. Originals of some of those newspapers survive (for example, the Philadelphia *Gazette and Universal Daily Advertiser* for Saturday, June 17, 1797); microform copies of others can be read at the Library of Congress.

The treaty was short—only three or four pages long in most texts, even including the ceremonial signature section—so the famous Article 11 was not likely to have been overlooked. Searches of the newspapers for the days and weeks after the treaty language was published reveal no record of any public dispute or protest over Article 11.

Also of possible interest is the fate of the senators who voted that day that the US "government is not in any sense founded on the Christian Religion." None seems to have paid a political price for his vote; among the twenty-three were many who were reelected as senators. One senator, Theodore Sedgewick of Massachusetts, went on to become Speaker of the House (Henry Clay is the only other American in history to be first a senator, then Speaker). Another, Isaac Tichenor, became governor of Vermont, and then returned to the Senate for many years. A Georgia senator, Josiah Tattnall, did not return to the Senate, but he did serve thereafter as one of the youngest governors in Georgia's history and has a county in Georgia and a number of streets, squares, and the like named after him. Any who might be tempted to recommend the senators or Adams as freethought heroes for their actions with regard to the Treaty of Tripoli should instead reflect with satisfaction that this secular declaration was apparently considered ordinary and was broadly known and accepted at the time. There seems to have been no confusion then about whether the American government was or should be secular.

ED BUCKNER

THE TRUTH SEEKER. The world's oldest FREETHOUGHT publication, *The Truth Seeker* was founded in 1873 by DeRobigne Mortimer BENNETT and his wife, Mary Wicks Bennett, in Paris, Illinois. D. M. Bennett was a former Shaker and successful businessman who made and lost several small fortunes before trying his hand at publishing. Inspired by Thomas PAINE, the Revolutionary hero and author of *The Age of Reason*, Bennett promoted freethought (and himself) like no one before or since. "We embrace, as in one brotherhood Liberals, Free Religionists, Rationalists [see RATIONALISM], Spiritualists [see SPIRITUALISM AND UNBELIEF], Unitarians [see UNITARIANISM TO 1961], Friends, Infidels, Freethinkers and in short all who care to think and judge for themselves," Bennett declared in *The Truth Seeker*.

The following year Bennett relocated the publication to New York City, where it continued to thrive and provide a forum for freethinkers for nearly a century. With the financial assistance of Morris Altman, a wealthy New York merchant, Bennett transformed *The Truth Seeker* into the best-known reform journal in America. In 1875 he began a widespread distribution of liberal books, tracts, and pamphlets. The enterprising editor reprinted Viscount Amberly's controversial *Analysis of Religious Belief* and sold *The Elements of Social Science*, an important birth control book by George Drysdale (see BIRTH CONTROL AND UNBELIEF). Bennett was one of the first booksellers in America to furnish readers with the Bhagavad Gita and Theosophist Helena P. Blavatsky's *Isis Unveiled* (see THEOSOPHY). The editor popularized the Darwinian discoveries by serializing Ernest HAECKEL's *The Doctrine of Filtration, or Descent Theory* in *The Truth Seeker* for three years (see DARWIN, CHARLES; DARWINISM AND UNBELIEF).

By the 1880s *The Truth Seeker* was practically an organization in itself with several thousand subscribers and fiercely loyal partisans. A prolific and provocative writer, Bennett published articles that dramatically chronicled his arrests, trial, imprisonment, and travels around the world. Bennett's "blasphemous" *An Open Letter to Jesus Christ* and *Sinful Saints and Sensual Shepherds*, exposing the immoral and criminal behavior or "black collar crimes" of Christian clergymen, amused freethinkers and infuriated religionists (see BLASPHEMY). "His journalism was of the sort called personal," one of his successors observed. "*The Truth Seeker* was Bennett, and in advertising himself he advertised the paper."

Eugene M. Macdonald became editor after Bennett's death in 1882. The following year *The Truth Seeker* faced a series of crises that nearly caused it to be discontinued. Among freethinkers there existed a broad divergence of opinions as to economic, political, and social questions. Even a letter printed in *The Truth Seeker* by Robert Green INGERSOLL explaining his Republican opinion on political matters caused readers to cancel subscriptions. Macdonald learned early in his career as editor that he had to tread lightly around politics.

During Macdonald's tenure, *The Truth Seeker* remained moderate on economic and political issues, avoiding populism and socialism (see SOCIALISM AND UNBELIEF). It remained steadfast and radical in maintaining separation of church and state. As editor of New York's most outspoken freethought and reform journal, Macdonald learned firsthand the effects of the alliance between church and state. In 1888 the editor was denied the right to vote because of his refusal to swear on the Bible. Eugene Macdonald's tenure as editor coincided with the birth of the militant labor movement in the United States (see LABOR MOVEMENT AND UNBELIEF). *The Truth Seeker* never hesitated in its attack on monopoly capitalists and supported labor reform and workers' rights. As early as 1877, D. M. Bennett saw a conflict on the horizon between capital and labor and castigated the "designing monopolists" and the "monied aristocracy" who, like Vanderbilt, were "rolling in affluence while the masses are stung with poverty and hunger." Like his mentor, Macdonald recognized the inequities of American society and continued to promote labor reform, and recognized and spoke out against the glaring disparity that he witnessed daily in the city of "magnificence and squalor," as he characterized New York.

In 1886 the Haymarket tragedy attracted widespread newspaper coverage and became a cause célèbre for the nation's freethinkers (see ANARCHISM AND UNBELIEF). During a peaceful gathering of striking workers at Haymarket Square in Chicago, a bomb was thrown, killing several civilians and eight police officers. Although the bomb thrower was never apprehended, the social revolutionaries or "anarchists" who organized the protest were arrested and later hanged. When it was learned that one of the anarchists was a member of the Chicago Liberal League, the religious press began associating anarchism with ATHEISM. The tragedy caused antagonism toward anarchists and freethinkers—dividing the country and creating America's first "Red Scare." It took courage to defend the convicted anarchists whose trial was one of the most unfair in the annals of American jurisprudence. Macdonald, who wrote passionately in defense of Bennett years earlier, maintained that the Haymarket defendants were convicted for their "opinions" and asserted: "The police by perjury connected the defendants with some wretch who threw a bomb, the lower court by partiality secured their conviction, and the higher court by sophistry sustains the verdict."

Macdonald's philosophy of life was formulated from the teachings of Stephen Pearl Andrews, one of

America's most prominent individualist anarchists and a close friend of Bennett and the Macdonald family. Although Eugene was a lifelong disciple of Andrews's doctrine of individual sovereignty, he had no sympathy for violent extremists. His initial response to the Haymarket tragedy exposed his naïveté when he wrote, "Even in war, no nation would use such horribly murderous weapons as dynamite bombs."

During Macdonald's watch, *The Truth Seeker* aggressively campaigned against church-sponsored laws that restricted citizens from enjoying social activities on Sunday, their only day off from work. Macdonald believed that Sunday laws were some of the most restrictive and menacing laws ever enacted. In 1891 *The Truth Seeker* played a pivotal role in securing the opening of New York museums on Sunday (a major triumph for freethinkers during the late nineteenth century, when religionists had a stranglehold on American society). "We have too much liberty," a clergyman with whom Macdonald debated the archaic Sunday laws declared in a newspaper. But when Macdonald asked the clergyman what "liberty" he would be willing to give up, he had no reply.

It was due to Macdonald's level-headed methods that *The Truth Seeker* kept afloat during the latter part of the nineteenth century. Assessing Macdonald's important contribution to *The Truth Seeker*, his brother George Everett Hussey MACDONALD wrote: "Institutions have their founders, and generally their saviors. Bennett and E. M. Macdonald played those parts. He always kept his balance, never leaning either way to get the favor of radical or conservative, nor committing *The Truth Seeker* to any advocacy but that of Free Thought, Free Speech, and Free Press." Eugene Macdonald died at the age of fifty-four on February 26, 1909. It is fitting that the man who devoted his life to promoting individual sovereignty and fighting for civil liberties for his fellow Americans died in a small village in upstate New York called Liberty.

George E. Macdonald succeeded his brother as editor of *The Truth Seeker*, the only significant freethought publication left in America (the *BOSTON INVESTIGATOR*, the oldest and most influential freethought journal in the nation, had suspended publication in 1904 and merged with *The Truth Seeker*). Freethought was still an unpopular cause and the twentieth century posed a new series of complicated challenges for the movement. In 1909, the year George Macdonald became editor, the centenary of Thomas Paine's death was celebrated. Serving as the primary organ to keep enthusiasm for the author-hero alive, *The Truth Seeker* proudly reported that Paine's influence was "steadily growing." That year also marked the one hundredth anniversary of Charles Darwin's birth. The evolutionist's influence, however, was still being debated and would not come into prominence in America for another decade and a half.

One of the most shocking events to confront the world's freethinkers and reminiscent of the Spanish Inquisition was the execution in 1909 of Francisco FERRER, the freethinking Spanish educator. Ferrer's rationalistic approach to teaching that excluded religious dogma infuriated Spain's powerful and pious government officials. *The Truth Seeker* was in the vanguard in recognizing Ferrer's "modern" philosophy of education and in exposing the injustice suffered by the educator, that Macdonald reported was "instigated by the church." The periodical began publicizing Ferrer's persecution during his trial in 1906; the case became a cause célèbre for intellectuals, scholars, and humanitarians. While the world's leading newspapers and magazines remained mute or indifferent during Ferrer's trial and execution by firing squad, Macdonald aggressively defended the educator and was relentless in his condemnation of the persecutors. *The Truth Seeker* gave voice to the world's freethinkers who were outraged at Ferrer's execution by church and state.

During World War I, free speech was fiercely suppressed in America. Despite difficulties, *The Truth Seeker* refused to let truth become a casualty during the war years. As they did during the Haymarket tragedy and in response to the McKinley assassination, some religious leaders denounced freethought. Outrageous statements by prominent priests and pastors such as "Darwin caused the war" and "atheists will be the first to be shot in the back when forced to go to war by conscription" were reported in *The Truth Seeker*. (George Macdonald's sons volunteered and served honorably.) *The Truth Seeker* remained patriotic, fiercely loyal, and above reproach; nevertheless, it was repeatedly suppressed for advocating SECULARISM. *The Truth Seeker* consistently reported the religious rhetoric of political leaders who claimed to have God on their side. George Macdonald's hard-hitting editorials exposing church graft and his unwavering attacks on the unethical actions of the YMCA and the Salvation Army earned the publication intense scrutiny. After an associate editor took issue with an Illinois governor over a religious argument, the solicitor of the post office in Washington pronounced *The Truth Seeker* "unmailable under the Espionage Act." When the editor of the magazine the *Nation* came to *The Truth Seeker*'s defense, it was also excluded from the United States mail.

The birth of "fundamentalism" in 1922 was initially thought by many freethinkers to be just another innocuous denominational religious movement within the church. But when the "curious phenomenon," as Macdonald described it, declared war on science and began aggressively campaigning against evolution, the editor fought back. Charles Darwin's scientifically established facts of evolution were promoted in *The Truth Seeker* since its inception. "*The Truth Seeker*," Macdonald wrote, "has been in the thick of the fight, and had dealt many effective blows against the champions of obscurantism." Not since D. M. Bennett's 1879 trial had the periodical gone to such an extent as it did while cov-

ering the Scopes Trial in Tennessee. Clarence DARROW (a second-generation subscriber) staged a brilliant cross-examination of William Jennings Bryan that filled six columns in *The Truth Seeker*. Some of the nation's newspapers called the trial a "tragedy," others a "comedy." One dubbed it a "comical tragedy." George Macdonald characterized it as "an inquisition" and predicted from the outset that the teacher would be convicted.

By the 1920s *The Truth Seeker* was no longer self-supporting and George Macdonald depended on donations to continue publishing. The stock market crash in 1929 and the subsequent economic collapse forced the editor to curtail production; the weekly became a monthly in 1930. Another dilemma faced by the elderly editor was whom to leave in charge of the publication, a concern neither D. M. Bennett nor Eugene Macdonald had needed to confront. The fact that the periodical was no longer a moneymaking endeavor limited the possibilities of finding a worthy candidate to sit in the editor's chair of what had become the world's oldest freethought publication. "There is admonition against crossing a bridge until you come to it," Macdonald wrote, "but there is a bridge not far ahead, and it may be down."

A militant group of freethinkers emerged in the 1920s. Stifled by Draconian laws restricting free speech during the war, these unremitting atheists lashed out against Roman Catholicism, fundamentalism, and other religious revivals that threatened progress. Their public street speaking and confrontational manner terrified religionists. One of these radicals was Charles Lee SMITH, who began contributing articles to *The Truth Seeker* in 1923 and selling the journal on the streets of New York, where he was arrested three times in 1924. In 1925 Smith, along with two other contributors, Freeman Hopwood and Woolsey TELLER, organized the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM, or the 4As, as it was known.

In 1937 the eighty-year-old Grand Old Man of Freethought—as George Macdonald is fondly remembered—reluctantly turned the monthly over to Charles Smith. Macdonald did not share Smith's militancy, but he admired his fortitude and determination. "He has lectured and been hissed, debated and lost the decision, taken the aggressive and been repulsed, agitated and landed in jail, talked Atheism and been convicted of blasphemy, attempted the enlightenment of a prophet of God [Aimee Semple McPherson] and been fined for his pains. And he thinks the Four-A's will win the world," the veteran editor wrote. Although George Macdonald did not describe himself as an atheist, he also never denied the accusation. "That means without God," he was quoted as saying by the *New York Times*. "Why should I say I am without a God any more than I would say I am without a devil, a spook or without whatever you can think of?"

George Macdonald continued as editor emeritus and contributed his "Observations" column until his death at the age of eighty-seven on July 13, 1944. "He [Macdonald] was the central and abiding factor in American Freethought for half a century," Smith declared.

"The world owes an enormous debt to the fighters for human freedom," Clarence Darrow wrote about George Macdonald and his fellow freethinkers. "And we cannot suffer their names to be forgotten now that we are reaping the fruits of their intelligence."

Charles Smith was publisher of *The Truth Seeker* from 1937 until 1964. Although Smith was one of America's most courageous atheists, he was also a racist; the once venerable publication became a soapbox for Smith's narrow-minded ideology. In 1964 James Hervey JOHNSON, a San Diego bookstore owner and former county tax assessor who shared Smith's bigotry, bought *The Truth Seeker* and moved it to San Diego. During Johnson's stewardship, *The Truth Seeker* deteriorated into a shoddy, semiliterate sheet filled with his racist rants. Johnson died in 1988, leaving a sizable estate that was placed in trust to finance *The Truth Seeker*, to expose religion against reason, and to publicize his views on religion and health. (Madalyn Murray O'HAIR, America's most notorious atheist, challenged Johnson's will in probate court without success.) Subsequently, Johnson's estate and *The Truth Seeker* have been controlled by lawyers, trustees, and editors with various visions.

Soon after Johnson's death, *The Truth Seeker* was acquired by Bonnie Lange, known as a New Age enthusiast. Lange published a slick periodical that recognized the historical importance of freethought and often paid tribute to Thomas Paine, Robert Green Ingersoll, and D. M. Bennett. Her journal, however, contained more metaphysical speculation than Bennett or the Macdonald brothers would have seen fit to print. After Lange published an informative 125th Anniversary historical issue in 1998, *The Truth Seeker* lapsed into obscurity.

Like most nineteenth- and early twentieth-century freethinkers, D. M. Bennett was inspired by Thomas Paine and believed that religious faith would fade in time under the light of scientific truth. Nevertheless, Bennett knew that superstition was resilient and that his religious opponents were a formidable force. "He asks that we continue the work he left unfinished" is engraved on the Bennett Monument in Green-Wood Cemetery, in Brooklyn, New York (see MONUMENTS TO UNBELIEF). Freethinkers can only hope that someday a rational publisher who shares Thomas Paine's humanitarian ideals will continue D. M. Bennett's work and recommit *The Truth Seeker* to "Free Thought, Free Speech, and Free Press."

ROD BRADFORD

TSUN TZU (XUN ZI; ca. 291–238 BCE), Chinese atheist scholar. Also known by his personal name, Kuang, Tsun Tzu is regarded, after Confucius and Mencius, as the third sage in the Confucianist hierarchy (see CONFUCIANISM). By no means as renowned in the West as his predecessors, he never received a Latinized name. His dates are uncertain, but ca. 298–238 BCE has been generally accepted. He seems to have been an educational official in the Shandung province, but spent much of his time in teaching and research. His main writings, which are basically the only source of our knowledge of him, are in the book of which his name is the title, which is a series of essays on a variety of themes. Some of the themes, such as his emphasis on logic, his belief in progress, and his critical analysis of other philosophical schools, have made him more attractive to modern Chinese students than he seems to have been either to his contemporaries or to their successors over the ensuing two millennia. His essays have in fact a much more analytical structure than either the *Analects* of Confucius or Mencius. There is less of the pithiness of these writings, with none of the *Analects*' sometimes cryptic style; Tsun Tzu develops his arguments in a way not dissimilar to Western philosophical writings, pursuing issues logically and consistently.

Because two of his students, Han Fei and Li Ssu, became leading figures in the Legalistic School, Tsun Tzu has sometimes mistakenly been linked with that school, a viewpoint encouraged by the authoritarianism manifested in his teaching and writing. However, his emphasis on *li,* propriety, is essentially that of Confucius. Equally Confucian is his rejection of the word "supernatural" to describe occurrences of an unusual, inexplicable or spectacular nature. He is pre-Humean (see HUME, DAVID) in his rejection of the belief in miracles or ghosts: only if accepting the reality of these phenomena were more rational than rejecting them would he concur. "Ghosts," he wrote, "are imagined by confused people."

Like Confucius, he wrote about *T'ien*, or heaven, and at times used phrases such as "the will of heaven" or even "God's will." It is clear, however, that by these phrases he did not mean a dynamic spiritual entity but rather the world of nature, to which all people belonged and which helped them to live with a steady and unwavering purpose. In order to serve human beings, he said, it was necessary to follow natural laws. In his essay "On Heaven," he wrote: "It is better for us to conquer heaven than to overestimate it. It is better for us to control and use heaven's will than to praise it." The belief that a divine being, God, controlled the world, including human destinies, seemed to him absurd. Those who argued that they had (for example) prayed for rain and it had then rained were treated with bemusement on Tsun Tzu's part: it proved nothing, he said, for it would have rained anyway, even if nobody had prayed for it.

His main area of contention grew out of the question of whether human nature is naturally good or bad. His predecessor a century earlier, Mencius, had presented a forceful case for natural goodness, arguing that it was only society which modified or eroded the goodness with which everyone is born. It was, he argued, as natural to be good as it is for water to flow downhill rather than up. Tsun Tzu held precisely the opposite view. In his essay "The Nature of Man Is Evil," he affirmed: "Men are born with the love of gain. . . . They are filled from birth with the envy and hatred of others." Only by the strict observance of propriety could any person overcome this inherent selfishness. He did not deny that benevolence (Confucius's *jen*) was desirable, but asserted: "One cannot be brought up without propriety, a business cannot be done without propriety." Linked with this idea, he taught in another essay that morality should be the product of education, since schools existed to shape character. He thus establishes himself as a forerunner of Dr. Thomas Arnold, groundbreaking headmaster of Rugby School, England, in the nineteenth century. It is an idea based on ARISTOTLE's view that one of the chief functions of the state is to make the people good. Because of this view, he has often been compared to Thomas HOBBES, in contrast with Mencius's Jean-Jacques ROUSSEAU.

Until the twentieth century, Tsun Tzu held a secondary role in Chinese esteem, but his humanistic views have enhanced his reputation greatly in modern China. His stress on the need for self-reliance, together with his view that everything which is of value is the result of human effort, have in fact raised him today to a position of considerable eminence.

RAY BILLINGTON

TURMEL, JOSEPH (1859–1943), French ex-priest and FREETHOUGHT writer. Born into a poor and pious family in Rennes, France, Joseph Turmel was selected at school by a priest to pursue religious studies at the Rennes Great Seminary. He received higher education at the Angers Catholic Faculty, was ordained in June 1882, and in August of that year appointed professor of theology at the Rennes Great Seminary. He was then as fervent a believer as he was a clever and meticulous scholar.

In 1886, having made numerous translations from Hebrew, Greek, Latin, and German theological texts, he suffered a crisis of faith that definitively placed any belief in any religious dogma beyond his reach. He succeeded in hiding his new SKEPTICISM until 1892, when he was denounced by a student. After eighteen months in what amounted to ecclesiastical prison, he was dis-

missed from his professorial position but—at this time—still permitted to remain within the Catholic Church.

By 1898 he had begun to publish in the *Revue d'Histoire et de Littérature Religieuse* (RHLR). Directed clandestinely by the scholar and philosopher Alfred Firmin Loisy, RHLR provided a forum in which Catholic modernists could challenge—often defy—conservative theologians of the Roman church.

Until 1908 Turmel split his output between publishing under his own name in official reviews and under a series of pseudonyms, mainly in RHLR. Among his early pseudonyms were Herzog for his writings about the Virgin, and Dupin for his writings on the Trinity. In 1908 Pope Pius X condemned all forms of modernism in an encyclical; Loisy was excommunicated and Turmel was severely admonished. Until 1931 he would publish exclusively under pseudonyms (some fifteen), principally Coulange, Lagarde, Delafosse, Perrin, and Galerand.

In 1930 he was caught up in the conflict between Pius XI and Action Française, a political movement stressing nationalism and French sovereignty in the face of papal authority. Among those conspicuous in this group was Charost, archbishop of Rennes, who had secretly been protecting Turmel against further sanctions. Unprotected, Turmel was excommunicated *vitandus*—that is, by name, publicly and by judicial sentence, the most severe form of excommunication—and defrocked. Defying the pope, Turmel continued to affect priestly vestments until his death.

He published a series of works for the publisher Rieder, and for the review *L'Idée Libre* founded by Andre Lorulot. He affiliated with the National Federation of Freethinkers (see France, Unbelief in) in 1935 and also served as honorary president of the Rennes Freethinkers Association. His most important work was *Histoire des dogmes* in six volumes, published by Rieder in 1935–37.

Turmel's motto was "Having been martyred for the truth, I shall be its apostle." A good summary of his materialist philosophy is given in his *Dieu*: "If a God exists, that's to say, a person endowed with intelligence and will, to whom belongs world government, this God has produced knowingly and deliberately all the evil which we are so harshly afflicted with; he is entirely responsible for this evil: God is a monster, he fills us with horror. But God does not exist. The world runs governed by mechanical laws of universal energy which exclude any outside intervention."

Turmel is well remembered. A colloquium was organized in Rennes to mark the sixtieth anniversary of his death. In addition to publishing the colloquium proceedings, several of his main books were reissued, including his *Autobiographie*, *Les Religions*, *Apocalypse et Quatrième Evangile*, and *La Sainte Vierge dans l'Histoire*. Contemporary study of his works reveals Turmel as a true materialist without any faith, a continuous defender of French institutional anticlericalism (*Laïcité*) as realized in the French state and its schools since 1905.

Michel Le Normand

UNBELIEF AND IRRELIGION, EMPIRICAL STUDY AND NEGLECT OF. There have been countless conceptual, theoretical, historical, apologetic, critical, and philosophical treatments of unbelief, irreligion, and related topics. Direct empirical studies, however, are comparatively few. There are numerous reviews of empirical research on religion, the religious, and religiosity, but there is no comprehensive summary of what available data do and do not reveal about the nature, antecedents, and correlates of affirmative unbelief and irreligion.

In his 1985 *Encyclopedia of Unbelief* entry "The Geography of Unbelief," William M. Newman observed that "unbelief has rarely been the direct focus of empirical studies in the social sciences" and that "information [on unbelief] typically is gleaned as a residual from studies of religious belief, identity, and affiliation." This remains true to the present. Findings can be culled from research on religiosity, the "unchurched," "nones" (those who declare no religious preference), "apostates," and religious doubt, among others. But what these tell us about the affirmatively irreligious varies greatly and must be carefully qualified. The aim here is to provide a map of the terrain where pertinent data may be found. Following this, some reasons for the general absence of direct research on irreligion and directions for future research are considered.

"Unbelief" and "Irreligion." Imprecise and inconsistent use of terminology is an obstacle to meaningful accumulation of knowledge on these topics. Reflecting a substantive definition of "religion," primary interest here lies with individuals who substantially or affirmatively (1) eschew theistic, transcendent, or supernatural worldviews; (2) consider such matters unknown, unknowable, or meaningless; and (3) do not identify with "traditions" or affiliate with institutions that embrace such worldviews. "Unbelief" and "unbelievers" reflect the first two of these criteria; "irreligion" and "irreligious" reflect all three (see Eupraxsophy).

As in these definitions, language and long intellectual tradition in the West frame these subjects in terms of "religion" and its negation. It is useful to bear in mind, however, that what we wish to understand is not merely the absence or rejection of something called religion. We also wish to understand ways of conceptualizing and approaching human life that represent positive *alternatives* to those that involve theism, transcendentalism, or supernaturalism.

Religion Research. The fact that "religion" represents both a general field of inquiry concerning existential worldviews, and also very particular *kinds* of worldviews, has long been problematic. Empirical research

bearing on alternatives to substantively religious approaches is largely to be found in religion research, the scientific study of religion, and the anthropology, sociology, or psychology of religion, among others. Since the primary focus in these fields is religion—variously defined—unbelief, irreligion, and related topics receive limited attention as direct subjects of inquiry. For example, the first twenty-year index (1961–81) of the *Journal for the Scientific Study of Religion* listed only 9 of 562 titles relevant to the affirmatively irreligious, such as "apostates" or "religious defectors," "nones" or "nonaffiliates," the "unchurched" and "secularists." Apart from "secularization," no summary categories on irreligion or related concepts appeared. Rather, most of these studies appeared under categories such as "religiosity," "religious behavior," and "socioeconomic status and religion."

There has been some increase in attention to topics such as "the unchurched," "apostates" (or religious "defection," "disaffiliation, and "switching"), "nones," and religious doubt in the past two decades. But there is still little direct focus on the affirmatively irreligious, whether "unlabeled" or "labeled" (as atheists, agnostics, religious skeptics, rationalists, humanists, freethinkers, and so on). For example, of some 150 articles that appeared from 1989 to 2004 in the annual publication, *Research in the Social Scientific Study of Religion*, one title referred to "religious doubt" and another to "belief and unbelief." Additionally, one longitudinal study, five articles on secularization, and twelve on religiosity provided data of widely varying relevance to irreligion. Among the latter were articles on religiosity and secularization in Europe that indicate greater attention to atheist, agnostic, scientific, and other nonreligious worldviews among European social scientists. Yet in two articles concerning future directions for religion research, no mention is made of irreligion or any related topic.

The Unchurched and Apostates. The "unchurched" include all who report that they do not affiliate with religious institutions or have not regularly attended formal services for a period of time (such as six months or a year), regardless of beliefs. The category is therefore quite broad, including both religious believers and unbelievers. Depending upon definitions, year of study, and sampling techniques, estimates of the unchurched range from 35 to 50 percent of the US population.

Typologies of the unchurched may reflect constituent unbelievers, as in J. Russell Hale's "true unbelievers" category (subdivided into "atheists/agnostics," "deists/rationalists," and "humanists/secularists"). But little attention is typically devoted to the irreligious subset. Aggregate data on the unchurched provide general indications about those who are relatively less religious (for example, with respect to geographical distribution or population changes in general religiosity over time). But they do not provide an accurate picture of the irreligious. A substantial majority of the unchurched in the United States, for example, pray, believe that Jesus Christ was the son of God, and desire religious training for their children.

Apostasy (or "religious defection" or "disaffiliation") refers to the abandonment of prior religious beliefs, affiliation, or identity at some point in life. Loss of apostates' religious participation is of concern to the churches they have left regardless of the stances they have adopted. With respect to understanding the irreligious, however, the relevance of data on apostates depends upon the orientation they have adopted by the time they are studied (such as unaffiliated religious belief, no stated religious preference, or affirmative irreligion). Among apostates who simply report no religious preference, several types have been identified that vary widely in religious beliefs and behavior, moral views, and lifestyles. In general, such individuals tend to be more often male than female, young, unmarried, well educated, and morally or politically liberal.

Psychologist Bruce Hunsberger and his colleagues have provided more relevant data in a series of studies of Canadian high school and college students who adopt substantially irreligious stances. They tend to measure low in authoritarianism, high in complexity of thinking, and they exhibit a more gradual process of attitude change that begins earlier in life than among religious converts. Weak or inconsistent findings emerge concerning psychological and social adjustment (such as reported happiness, optimism, or self-esteem). Earlier findings that suggested poor relations between young apostates with no religious preference and parents or other authority figures are not borne out by Hunsberger's data on irreligious apostates.

Survey Research—of "Nones" and "Nots." Survey research has become a valuable tool for mapping the nature, prevalence, temporal shifts, and geographical or cultural distribution of religious beliefs, affiliation, and related variables. Data on unbelief and irreligion are residuals of this work. Further, in survey research, findings follow form (of the questions put to respondents). For example, a widely cited Gallup "yes-no" measure has pegged US believers in God (or a higher power) in the mid–90 percent range for decades. But as George Bishop has illustrated, more detailed questions produce very different results.

When Gallup offered more options in three separate surveys, 8 to 10 percent of respondents said, "Don't really think there is a God," "Don't really know what to think," or "Don't know." When the Barna Group put even more nuanced questions to respondents about "God" in 1994, 67 percent subscribed to a traditional theistic conception (with an additional 3 percent endorsing polytheism), 10 percent thought of God as "a state of higher consciousness that people can reach," 8 percent endorsed "the total realization of personal human potential" (with an additional 3 percent feeling that "everyone is God"), 8 percent professed ignorance on the matter,

and 2 percent said "no such thing." Religiosity and irreligiosity are better viewed as complex and continuous rather than as unidimensional or categorical variables. This said, finer-grained methods, analysis, *and* reporting are required to more meaningfully ascertain the prevalence of substantially nonreligious worldviews.

The most prevalent survey category relevant to the irreligious is known as "nones," a term that indicates that this is a function of survey method rather than a self-description. It refers to respondents who do not choose or volunteer a specific religious affiliation or identification, or who state "no religious preference" or "no religion." Included are the unaffiliated religious or "unchurched believers," atheists, and many gradations of belief and behavior in between. Data from sources such as the National Opinion Research Center's General Social Survey indicate that substantial percentages of "nones" hold religious beliefs, pray, or express confidence in the value of organized religion despite their lack of religious preference. As with the unchurched, data on "nones" supply suggestive findings about the relatively less religious, but not a detailed picture of the attitudes or behavior of those who are affirmatively irreligious. In other words, "nones" include, but are not equivalent to, "nots" (the affirmatively irreligious).

In a review of research from the 1950s to 1984, Norvall Glenn found that "nones" gradually increased from roughly 2 to 7 or 8 percent of the US population. In the 1990s a more rapid rise was observed from 7–8 to 14–15 percent in several sources, such as the 2001 American Religious Identification Survey (ARIS) and the General Social Survey (GSS). Michael Hout and Claude Fischer have offered evidence that the more recent increase may be attributable, in part, to a political alienation effect: as religious conservatism has grown in public prominence and political activity in the United States, some religious liberals may be distancing themselves from the phenomenon by relinquishing public religious identity or affiliation.

With respect to the incidence of "nots," analysis of specific survey items on religious beliefs, behavior, and identification yields useful but inconclusive results. Based on ARIS data, Keysar, Mayer, and Kosmin found that 3 percent of Americans profess "no religion," disagree that "God exists," and consider themselves secular rather than religious. GSS data indicate that from 1988 to 2002, an average of 6.5 percent of Americans said that they either "don't believe in God" or "don't know . . . and don't believe there is any way to find out." The Barna Group found that in annual surveys from 1995 to 2004, 7 to 13 percent of respondents were "atheist," "agnostic," or held "no religious faith." However, as many as 2 percent of these attended churches, 13 percent believed in the accuracy of the Bible, and 19 percent prayed. Work is clearly needed to consistently differentiate and accurately map the incidence of distinguishable forms of irreligion with respect to beliefs, behavior, and self-descriptions.

National surveys are perhaps not the most efficient method for studying the irreligious in depth, particularly in the United States. It is equally true, however, that organized irreligious populations (e.g., atheists, agnostics, religious skeptics, and secular humanists, among others) remain notably underresearched.

Direct studies of affirmatively irreligious populations in the United States are so rare that one of the most frequently cited is a report on members of an atheist organization—published in 1932. The finding for which this study is most often cited is that an unreported number of respondents under twenty years of age indicated a greater incidence of parental loss than in the general population at that time. Whether this is representative of other atheist or irreligious populations is unknown. It is not supported by Altemeyer and Hunsberger's data on young irreligious apostates. (It should be noted, too, that Vetter and Green's young atheist cohort would have spent their formative years in the World War I era—a time of pervasive cultural doubt and family loss in the West. Historical and cultural factors have powerful generational effects on religious and irreligious beliefs.)

One of the most valuable populations may be American scientists (especially behavioral and social scientists). James H. Leuba's pioneering surveys of belief and disbelief in a personal God and immortality among US scientists suggested that the scientific community holds one of the largest concentrations of substantially irreligious individuals (see Scientists, Unbelief among). Leuba's findings in 1914 and 1933 that a majority of the American scientists he surveyed did not affirm beliefs in a personal God or immortality, and that such beliefs were substantially rarer among "elite" than "lesser" scientists, were generally replicated in the 1990s. The methodology employed, however, was admittedly narrow in scope.

Subsequent research has addressed some aspects of academicians' (ir)religiosity. In general, academicians tend to be less religious than the general American population. Those who are more eminent or productive, committed to critical thought, intellectualism, or a "scholarly perspective" of open-ended inquiry, tend to be less religious. Consonant with Leuba's findings, disciplines in which religion is studied as a natural phenomenon (e.g., the behavioral and social sciences) tend more to attract and reinforce irreligious individuals (than the natural sciences).

Many questions remain, however, about the variety, content, correlates, and consequences of scientists' worldviews. In most of this research, (ir)religiosity is narrowly defined as the presence or absence of "Judeo-Christian" beliefs and behaviors (such as ideology, experience, ritual observance, and doctrinal knowledge). There has been limited differentiation of scientists' worldviews—religious, spiritual, or irreligious. Also, beyond general assessments of scientists' (Judeo-Christian) religiosity and selected antecedents, this population has not been closely scrutinized with respect to health,

mental health, and other correlates of religious or irreligious worldviews.

International survey research suggests that culture may play a part in shaping social scientific approaches to religion and irreligion. Sources such as the World Values Survey, International Social Survey, and Pew Global Attitudes Survey consistently place the United States highest among economically developed and Western nations on measures of religious belief, behavior, and importance (with Ireland and Poland close by). Belgium, the Czech Republic, England, France, Germany, the Netherlands and Scandinavian countries are among the lowest. This may account for a greater willingness among European researchers to speak of atheist, agnostic, or "scientific" alternatives to religious worldviews.

Sociology of Religion and Irreligion. Given the theoretical importance of the concept of secularization, more direct attention to the irreligious might be expected in sociology. This has, however, proven to be the case only to a limited extent. This may be attributable to three central sociological preoccupations: functionalism, institutionality, and—paradoxically—secularization.

There has been intermittent theoretical and empirical attention to irreligion in sociology, particularly in the mid- to late twentieth century, when the secularization of "modernizing" societies seemed inevitable and well on its way (see DEMOGRAPHY OF UNBELIEF). Despite several promising starts, however, this never developed into a continuing line of sociological inquiry. Perhaps most notable was the work of Colin Campbell and N. J. Demerath III. Both sought to frame a sociology of irreligion and offered organizational analyses of irreligious movements. The substance of Campbell's *Toward a Sociology of Irreligion* was an analysis of secularist, humanist, and rationalist movements in the United States and England in the nineteenth and twentieth centuries. Contemporary empirical analyses of irreligion "on the ground" have been more rare. Demerath and Thiessen analyzed philosophical and organizational challenges contributing to the demise of a Wisconsin freethought community, for example.

Campbell's greater contribution was his analysis of possible reasons for sociological neglect of irreligion, which he attributed largely to the dominance of a functionalist view of religion as a universal feature of societies. Under the functionalist view "the religious" or "the sacred" are defined so broadly that substantially nonreligious worldviews tend to be overlooked or reconceptualized in such terms. This finds expression in such concepts as "invisible religion," "implicit religion," or "*homo religiosus*." Such expansion of the scope of *religion* tends to deny the epistemological legitimacy of unbelief or irreligion. In turn, this fosters a selective focus on "secular" features of society that lend themselves to analysis as though they were substantively religious (e.g., Marxism, psychoanalysis, environmentalism, or sporting events as "civil religious ceremonies"). This approach produces valuable insights, but it also tends to ignore alternative worldviews, social behavior, and affiliative patterns that are nonreligious or irreligious in meaningful senses. This tendency continues to be evident.

Paradoxically, the sociological view of the secular may discourage research on the irreligious by blurring distinctions between the mere absence of religion (as in purely economic or political activity) and deliberate avoidance or rejection of the religious, sacred, or transcendental. Concern has been, on a grand theoretical scale, with whether modernizing societies inexorably become less religious. In this context, the irreligious become a "deviant" minority footnote among many secular aspects of society.

At present, while European sociologists unavoidably attend to signs of "secularization" in their midst, resumption of an American sociology of irreligion is uncertain. Attention has been drawn to signs of religious resurgence and the challenges this presents to secularization theory. "Rational choice" and economic or market theories of religion stress the prevalence and benefits of religious belief and affiliation. While there are intermittent signs of scholarly attention to secularism, atheists, and related topics, increased focus on the "sacred" or "spiritual" has generally tended to push the "profane" into the background.

The societal and institutional focus of sociology may also work against substantial attention to the irreligious. The minority status and limited, shifting organization of the irreligious may render them too dispersed to be picked up by sociological radar. As a result, research on the irreligious tends to be displaced toward the study of individuals—in psychology. Even there, however, this tends to be more a residual aspect of the "psychology of religion" than a direct subject of empirical inquiry.

Psychology of Religion, Religiosity, Doubt, and Unbelief. Inadequate conceptualization and empirical study of unbelief or irreligion in psychology has repeatedly been acknowledged. For example, Paul Pruyser suggested that framing the field in terms of unbelief or irreligion tends toward exclusion rather than recognition of "describable alternatives to a religious point of view." David Wulff questioned the belief/unbelief dichotomy, suggesting that this masks a rich range of belief systems and associated behavior. He also noted that prevalent use of fixed-item questionnaires tends to mask the range of individual differences and types, suggesting greater use of idiographic techniques. This is found in Altemeyer and Hunsberger's study of young apostates or European work on atheists and other unbelievers. These are, however, exceptions rather than the norm. Major texts in psychology and the psychology of religion typically provide few, if any, references or index entries pertaining to unbelief or the irreligious.

"Religious doubt" figured prominently in the early history of the field. However, this reflected a prevalent

view of such doubt as a natural, but transient, aspect of human development that, in normal circumstances, gives way to more mature religious commitment. This perspective continues to be evident today. Indeed, most psychological research on religious doubt or apostasy has focused on adolescents and young adults. Longitudinal research provides evidence of both stability and change in religious and irreligious orientations. And yet virtually no in-depth research with substantial samples of stable, long-term irreligious adults has been done.

The greatest vein of relevant information may be found in the large and rapidly growing literature on antecedents, correlates, and consequences of religiosity. This is, however, as much a minefield as a mine for data on the irreligious. Religiosity (assessed in various ways) has been correlated with measures of mental and physical health, coping styles, social behavior, life satisfaction, altruism, authoritarianism, prejudice, and so on. Findings present a positive-trending, but complex and inconsistent, picture of the relationship between varying forms or levels of religiosity and such variables.

As in survey research on "nones," while suggestive data about the relatively less religious can be culled from this work, relevance to the affirmatively irreligious is variable. Samples typically represent the general population, religious affiliates, college students, or special classes of individuals (e.g., medical patients). "Nonreligious" samples or control groups are frequently tantamount to "nones," with limited representation of substantially or affirmatively irreligious individuals. "Low religiosity" is a relative measure based on self-reports or scalar assessments of religious beliefs, behavior, and affiliation. Its meaning shifts with the nature of the underlying sample: low religiosity among religious affiliates is something apart from affirmative irreligion. Here as elsewhere, substantial samples of self-described atheists, agnostics, religious skeptics, secular humanists, or philosophical naturalists are rare. What is required is a painstaking analysis of studies and findings that are and are not pertinent to the irreligious.

The study of "mature" religion is pertinent. Gordon Allport provided an impetus for research on the topic by contrasting mature with immature forms of religiosity. These were further developed as "intrinsic" ("ends") and "extrinsic" ("means") religion. Batson added a third—"quest"—form of religiosity that is more searching and skeptical in nature. It is notable, however, that a parallel notion of "mature" unbelief or irreligion has never emerged. In fact, there is a noticeable tendency in some quarters to characterize secular, skeptical, scientific, naturalistic, or irreligious worldviews as puerile, myopic, pathological, or intrinsically inferior to the religious. Frank Barron suggested a distinction between "fundamentalist" and "enlightened" belief *and* unbelief. He offered a self-report scale and limited data employing it, but this has never been developed further.

Explaining the Neglect. The comparative size and cultural or political significance of the irreligious population may provide part of the explanation for empirical neglect (particularly in the United States). However, as Campbell observed, in absolute terms, the numbers of the irreligious are not negligible, whether in the United States or in countries with less religious populations.

Relatively weak organization of the irreligious may play a part. However, while specific irreligious movements and organizations have shifted over time, some have always existed since the emergence of the behavioral and social sciences (e.g., atheist, humanist, rationalist, secularist groups and organizations). They have been notably under-researched. Further, one of the largest accessible populations, that of irreligious scientists, has been studied only superficially.

Methodological lethargy may play a part. College students are quite possibly the most researched population, in part because they are conveniently at hand in the academy. Fieldwork is more demanding, especially with dispersed target populations. Yet researchers in many disciplines do go into the field or collaborate with a variety of institutions outside the academy (e.g., hospitals, clinics, churches) to study religiosity, religious organizations, and even small-scale sects, "cults," and new religious movements. There is more involved.

Campbell has suggested that the irreligiosity of many scientists may have rendered the phenomenon "too close to see." There are signs that naturalistic or other nonreligious worldviews are diminished or trivialized by some scholars—even "secular" ones. Boredom may be involved: newly emerging religious sects or "cults" are perhaps more novel and intriguing than "Enlightenment-style" worldviews, widely considered passé in "postmodern" intellectual circles. However, it has been in both periods of apparent secularization and religious resurgence that we find little direct empirical focus on the irreligious.

Cultural factors may be at work. A noticeable propensity for European researchers to focus more theoretical and empirical attention on irreligious individuals and worldviews may reflect differences in the prevalence and historical salience of such views. However, the volume and nature of empirical attention to the irreligious on both sides of the Atlantic has been limited.

Linguistic convention and intellectual heritage in the West concerning religion may tend to skew thinking about substantively nonreligious alternatives. As previously noted, there is a tendency in some quarters to define religiosity in such broad functional terms that to be human is unavoidably to be "religious." There is a need for a revised framework and lexicon that accords *positive* epistemological legitimacy to forms of substantive irreligion and allows for finer, yet consistent, discrimination among types of worldviews and associated behavior.

What Is to Be Learned? Whatever the explanations, limited research attention to the irreligious cannot be attributed to the possession of sufficient knowledge. Innumerable questions remain wholly or partially unanswered, such as:

- Why, when religiosity is so prevalent and the psychological rewards are widely promoted, do many individuals adopt and remain committed to irreligious worldviews?
- What distinguishable nonreligious or irreligious worldviews can be identified? What are their shared and differentiating attributes? How widely is each held?
- Is it meaningful to distinguish between "mature" or "immature," "positive" or "negative," "enlightened" or "fundamentalist" forms of unbelief or irreligion? If so, what are the antecedents, correlates, and consequences of such orientations (such as family background, prior religious experience, physical and mental health, personality characteristics, life satisfaction, social adjustment, or moral/ethical ideas and behavior)?
- What are the types, contents, antecedents, and correlates of scientists' worldviews?
- What are the patterns of social behavior and organizational affiliation among the irreligious? To what extent is there evidence of reduced social need among such individuals? Alternatively, to what extent do patterns of affiliation reflect philosophy, with social needs met by involvement in groups, organizations, or affiliative formats other than explicitly religious or irreligious ones?
- Are there identifiable differences between unbelievers who affiliate with organizations pertinent to their worldviews and those who do not?

Conclusion. There is need for change in the ways we conceptualize, categorize, and study those who hold positive alternatives to religious worldviews, or who affirmatively eschew worldviews and associated institutions concerned with the sacred, divine, transcendent, or supernatural. This call has been made repeatedly since the emergence of the behavioral and social sciences. It will continue to be made given the persistence of such alternatives, the people who affirm them, and the value of better understanding both.

FRANK L. PASQUALE

UNBELIEF AROUND THE WORLD. In *Atheism in the World* (2003), this author mapped the prevalence of ATHEISM in the world, accompanied by sketches about the history of atheism. *Atheism* as used in that book is more or less identical with *unbelief* as used in this encyclopedia, and encompasses AGNOSTICISM, FREETHOUGHT, NATURALISM, SECULAR HUMANISM, and SECULARISM. These terms are to some degree synonymous. In fact, the word *HUMANISM* alone, without any preceding adjective, is also often used to imply atheism.

Roots of Atheism. Atheism is in no way limited to the twentieth and twenty-first centuries. Material regarding atheism is easily found in the eighteenth and nineteenth centuries. But when we come to centuries before that, clear evidence of atheism is much scarcer. This does not mean that atheism only emerges in, say, the seventeenth century. But there is no good reason to assume that there have, throughout the history of humankind, always been sizable numbers of atheists. Available evidence around the globe indicates that atheism was rare in the eighteenth century, and even rarer before that.

In ancient Greek the word *atheos* (atheist) was mostly used as a word of abuse. A number of persons were called *atheoi*, "atheists" or "impious persons." In the period before SOCRATES, these persons included XENOPHANES and Anaxagoras, who were accused of impiety. By contrast, such figures as Diogenes of Apollonia, Hippo of Rhegium, PROTAGORAS, Prodicus, Critias, and Diagoras of Melos were accused of atheism.

Most of these persons were not atheists in the sense that they did not believe in God or gods. They believed in God or gods, but not always the "right" god(s). About a number of the preceding persons not much is known, and much of what is known about them is of limited interest for the history of atheism.

One of the persons mentioned above, Protagoras of Abdera, may have been an agnostic rather than a theoretical atheist. According to PLATO, Protagoras attacked the dogmatism of contemporary religion and philosophy. About the gods he reportedly said: "I am unable to know about the gods either that they exist or that they do not, and what form they have. For there are many things that prevent knowledge—both the obscurity of the subject and the shortness of human life."

In saying this, does Protagoras exemplify agnosticism? He claims that he does not know whether gods exist or not. This may be interpreted as saying that Protagoras is neutral with regard to theism and atheism. But it may also be interpreted as saying that Protagoras did not believe in any god, and hence was an atheist.

The best-known philosophers in Greek antiquity, Socrates, Plato, and ARISTOTLE, were not atheists. They believed in a god or in gods. Also, as different from most modern materialists, materialists in Greek antiquity believed in gods (see MATERIALISM, PHILOSOPHICAL).

In our search for the roots of atheism, we next turn to India (see INDIA AND UNBELIEF). India has often been assumed to have a long tradition of atheism. There is hardly any doubt that there have been some atheists in ancient India. In ancient India, atheism, naturalism (the view that nature is the ultimate cause), and materialism are intimately connected.

The author of the Indian atheistic school is believed to be CARVAKA, of whom little is known. The main work supposed to represent his views is the *Brhaspati Sutra* (ca. 500 BCE), which is lost. But it has been assumed that Carvaka's views can be reconstructed from contemporary Jaina and Buddhist texts and also from Hindu sources of the eighth century CE.

Summarizing the preceding, we can say that in ancient India there have been some atheists, but except for Carvaka their names are not known and their oldest writings have been lost. In ancient Greece we have been able to point to the agnostic Protagoras, who may also be called an atheist. But apart from Protagoras, atheists in ancient Greece, if any, have left few clear traces testifying to their existence.

In ancient China, some thinkers seem to have been close to atheism (see James Thrower's *The Alternative Tradition* for evidence for and against; see CHINA, UNBELIEF IN).

An early European atheist was the Italian Giulio Cesare VANINI. He questioned whether an immaterial God can create a material world, and was executed in a cruel way. Another early European atheist was the Pole Kazimierz Lyczynski, who published *De non existentia Dei* (About the Nonexistence of God). Lyczynski, too, was executed.

A third early European atheist is Jean MESLIER. It has been known for many years that Meslier was an atheist. He lived his whole life in the Ardennes in northern France; from 1689 until his death he was a parson (*curé*)

in the village of Estrépigny. The importance of Meslier for the French Enlightenment seems to have been limited (see ENLIGHTENMENT, UNBELIEF DURING THE).

After Meslier, atheism and/or materialism (or closely related views) were advocated in France by writers like Julien Offray de LA METTRIE, Denis DIDEROT, Claude Adrien HELVÉTIUS, Baron d'HOLBACH, Jacques André Naigeon, and Pierre John George Cabanis.

Of these, Diderot and Holbach are particularly important. Holbach in 1770 published his important book *Système de la nature* (System of Nature) using the pseudonym Mirabaud. The book was a sensation in France and was sharply criticized by representatives of the church. The book is very clearly atheistic and materialistic and for many years was regarded as the Bible of materialism.

From the nineteenth century many atheists are known, for example, Karl MARX, Friedrich Engels, and Friedrich NIETZSCHE. These names suggest that atheism can be combined with many different basic views, a tendency that has been strengthened in the twentieth century.

Contemporary Atheism. As a whole, until about 1850 atheists qua atheists remained unorganized. To the degree that they were organized at all, they tended to be organized in religious, social, or political groups, not in atheist groups as such. Statistics on atheism prior to 1900 are rare. Even after 1900, statistics giving information about the prevalence of atheism in various countries in the world are either lacking or very uncertain.

The book *Atheism in the World* presents statistics about religion and atheists in 190 countries drawn from the best available sources. Sadly, the "best available" sources are not of high quality. Their treatment of atheism is scanty, in many cases conflicting, and often unreliable. What in this article is called "atheism" in the preceding statistics in a number of cases is called "no religion," "none," or "nonreligious." Often the term "other" occurs, a term that may lump together atheists and agnostics with nontraditional religious believers.

Not all nonreligious persons are atheists or agnostics. Some simply have no opinion about atheism or agnosticism. On the other side, many persons who are counted statistically as religious believers in fact may be atheists or agnostics. There are, therefore, many uncertainties hidden in statistics on religion and atheism.

From these general remarks on contemporary atheism, we turn to some countries which seem to be interesting in accounting for the phenomena of atheism today.

North Korea. According to the available sources, North Korea is the country with the highest percentage of atheists in the world: 68 percent.

This estimate is based on official figures given by a regime which harshly persecutes adherents of traditional religions and, for that matter, many other people. Marshall's *Religious Freedom* does not indicate what "atheism" stands for in North Korea. There is no reason to believe that "atheist" in North Korean statistics stands for "convinced atheist." Atheism in that country was until the beginning of 2004 and many years earlier embedded in a political system that exerted tight control and largely barred independent public thinking on basic questions. Although there probably have been liberal atheists in North Korea, their voices have not been heard. The practice of human rights was almost nonexistent in North Korea during the 1990s. Traditional religions were repressed, but freethought was too.

China. From North Korea we turn to China, also a closed country, but not as tightly closed as North Korea. Here Marshall places the proportion of atheists at greater than 10 percent. According to other statistical sources, as early as 1980 religious affiliation among Chinese was distributed as follows: nonreligious, 51.9 percent; Chinese folk religion, 20.1 percent; atheist, 12 percent; Buddhist, 8.5 percent; Muslim, 1.4 percent; Christian, 0.1 percent; and other, 6 percent. These statistics suggest a total of 63.9 percent of agnostics or atheists. Barrett et al. count 50.7 percent of Chinese as nonreligious or atheists in 1995, also a high figure.

According to Marshall's *Religious Freedom*, China has to a greater or lesser extent repressed religion throughout the more than fifty years of Communist Party rule. Its aim is said to have been to make religion serve the interests of the communist state until religion disappears from Chinese society. This, according to Marshall, has remained the dominant view. State religious policy, as explained by Chinese president Jiang Zemin in March 1996, was "to actively guide religion so that it can be adapted to socialist society." Ye Xiaowen, head of the Religious Affairs Bureau, in 1996 urged the "handling" of religious matters according to the dictates of Vladimir Ilyich LENIN, and declared that "we will gradually weaken the influence of religion."

Taiwan. Marshall suggests the following statistics for Taiwan: a population of 22.3 million, of whom adherents of "Chinese religion" (Buddhist, Taoist, Confucian) comprise 80 percent; Christians, 4 percent; Muslims, 0.2 percent; atheists, 14 percent; and other, 1.8 percent.

Marshall offers no explanation why the percentage of atheists is so high in this noncommunist country (14 percent). One possibility is that atheism is more compatible with traditional Chinese culture than with traditional Western culture. In spite of tendencies toward secularization in Western countries, Western culture remains strongly influenced by Christianity, with its fear of and hostility toward atheism. We should not forget, however, that Barrett lists a mere 4.3 percent of "secularists" (atheists plus the nonreligious) in Taiwan for 1995. There is, thus, a serious discrepancy between 14 percent atheists in one source and 4.3 percent secularists in another one. They cannot both be right, and in fact, they can both be wrong.

South Korea. Whereas North Koreans remain under strict political surveillance, South Korea developed in a democratic direction beginning in 1987. Prior to 1987,

South Korea also had an authoritarian regime, but in marked contrast to North Korea's, the South Korean regime had a positive attitude toward religion. In 2000, South Korea had a population of 47.3 million. Marshall presents the population breakdown as follows: Christians, 48 percent; Buddhists, 40 percent; Confucians, 3 percent; and Shamanists, adherents of *Ch'ondogyo*, and others, 9 percent. These statistics suggest that at the end of the 1990s, the percentage of atheists in South Korea was less than 9 percent.

But a breakdown in *Britannica Book of the Year* paints a quite different picture: "religious," 51.1 percent (Buddhist, 23.3 percent; Protestant, 19.8 percent; Roman Catholic, 6.7 percent; Confucian, 0.4 percent; and traditional and other religions, 0.9 percent), with the "nonreligious" making up 48.9 percent. If these figures are correct, then South Korea is almost equally divided between the "religious" and the "nonreligious."

Meanwhile Barrett, an explicitly Christian source, shows only 1.6 percent secularists in South Korea in 1995. The discrepancy between these three figures (or sets of figures) is extreme.

Japan. The situation is similar in Japan. In 2000 its population was 126.9 million, with no official religion. Marshall gives the following breakdown: Buddhist, 49 percent; Shinto, 45 percent; Christian, 1 percent; and other, 5 percent. *Britannica Book of the Year* claims Shinto and related religions, 51.3 percent; Buddhism, 38.3 percent; Christian, 1.2 percent; and other, 9.2 percent. Meanwhile Barrett et al. find 12.9 percent secularists in Japan for 1995.

Japan is a country strongly influenced by Chinese culture with a high level of religious freedom. Despite vigorous missionary activity, Christianity has not been able to convert more than about 1 percent of the population. The percentage of atheists is quite uncertain. Atheists are generally lumped together with "other" groups credited with making up 5 to 9.2 percent of the population. Yet as noted above, Barrett et al. give a 12.9 percent figure as either atheistic or nonreligious. For his part, Marshall notes that "in Japan many people adhere to more than one religion: the total number of adherents is about twice the population." Thus, the percentage of atheists in Japan is quite uncertain, at the end of the 1990s comprising anywhere between 5 and 13 percent of the population.

As Buddhism has a central place in traditional Japanese culture, it may be noted that Buddhism in its traditional tenets does not presuppose any almighty god. Buddhism has sometimes been called an atheistic religion. Though this is misleading, Buddhism is in theory less negative toward atheism than Western religions like Christianity, Islam, and Judaism. Many atheists may feel at home in Buddhism, especially if they agree with traditional Buddhist tenets. So it is quite possible that some, even many, of the claimed 49 percent of Japanese who are Buddhists may also be atheists.

Similarly, many of the 40 percent Buddhists in South Korea may be atheists. The low percentage of Buddhists in North Korea, only 2 percent, may be due to the limited freedom of religion and belief in that country.

Percentages of Atheists. The same lack of freedom of religion and belief in North Korea may lead us to look at the figure of 68 percent atheists given for that country with suspicion. If we disregard the dubious case of North Korea and try to assess the percentages of atheists in the remaining countries, Marshall's *Religious Freedom in the World* suggests the following order:

1.	Latvia	43.7 percent
2.	Cuba	40 percent
3.	Estonia	39 percent
4.	Russia	32.1 percent
5.	Netherlands	30 percent
6.	Moldova	28.1 percent
7.	Belarus	27.7 percent
8.	Germany	27 percent
9.	Uzbekistan	25.5 percent
10.	Ukraine	25.3 percent
11.	Kazakhstan	23 percent
12.	Belgium	20 percent
13.	Armenia	17.7 percent
14.	Georgia	15 percent
15.	Singapore	14.3 percent
16.	Romania	14 percent
17.	Taiwan	14 percent
18.	Lithuania	13.1 percent
19.	Spain	13 percent
20.	Hungary	12.5 percent
21.	Finland	12 percent
22.	United States	11 percent
23.	China	10+ percent
24.	Vietnam	10 percent
25.	Austria	9 percent
26.	France	9 percent
27.	United Kingdom	5 percent
28.	Norway	3.2 percent
29.	Brazil	3 percent

Even among these figures, many are probably erroneous, as Marshall does not maintain any consistent definition of "atheist" from country to country. For example, his statistics for Hungary (12.5 percent) actually reflect a 12.5 percent minority categorized as "nonreligious/other." This category may include religious believers as well as atheists and agnostics.

It will be apparent that many of the countries with large percentages of atheists have been under the influence of Soviet communism: Latvia, Cuba, Estonia, Russia, Moldova, Belarus, Uzbekistan, Ukraine, Kazakhstan, Armenia, Georgia, Romania, Lithuania, and Hungary. Countries like China and Vietnam nowadays exhibit a mixture of communism and capitalism. Still, the high (or fairly high) percentages of atheists in these

countries can perhaps partly be explained by communist influence.

But note that according to Marshall, Bulgaria, for many years within the Soviet sphere of influence, had few atheists, perhaps less than 1 percent (classified under the category "other"). Poland, too, seems to have few atheists, the category "other" comprising just 1.7 percent of the population.

As for the former Soviet Union, Armenia is an interesting case. In the year 301, Armenia was the first state in history to adopt Christianity as its official religion. The Armenian Apostolic Church (78.5 percent) is still the largest religious community in Armenia. The second largest group in Armenia is the group of atheists and agnostics (17.7 percent).

Yet it will be seen that other countries with high percentages of atheists belong to the liberal Western sphere: the Netherlands, Germany, Belgium, Spain, Finland, and Austria. Though East Germany was strongly influenced by Soviet communism, the other countries in this group have no such background.

As far as evidence is available, there generally seem to be few atheists (less than 2 percent) in Islamic countries and in sub-Saharan Africa. An exception is Uzbekistan, with 68.2 percent Muslims and 25.5 percent "nonreligious/other." The human rights situation in Uzbekistan was in 1999 and for many years previously quite bad; Marshall gives the country a low religious freedom rating.

Another former Soviet republic, Kazakhstan, has a mixed population, with 47 percent Muslim, 25 percent Russian Orthodox, and 23 percent "other." As a result of Stalinist purges and enforced Slavic immigration during the Soviet era, ethnic Kazakhs constitute only about 45 percent of the population. Russians and Ukrainians constitute 35 percent. Approximately 80 percent of the Kazakhs self-identify as Muslims, for many a mainly nominal affiliation. About 60 percent of the Russians and Ukrainians identify themselves with the dominant Orthodox Church, also generally a nominal affiliation. Marshall gives no information about the 23 percent who are classified as "other," but probably many of them are atheists. The human rights situation in Kazakhstan in 1999 was not good, but somewhat better than Uzbekistan.

Soviet atheism may have had limited influence in Azerbaijan. In this country 95 percent are nominally Muslim, whereas according to Marshall less than 1 percent seem to be atheists. Yet Barrett et al. put the figure of atheists and nonreligious in Azerbaijan in 1995 at 11.7 percent, which is quite high for a Muslim country.

A similar situation prevails in Turkmenistan, with a putative 89 percent Muslims and 9 percent Eastern Orthodox. Apparently there are few atheists in this country. But again, Barrett et al. put the figure of atheists or nonreligious in 1995 at 11.7 percent. Freedom of religion in this country has for many years been very limited. In terms of human rights, Turkmenistan has for many years been one of the most repressive of the former Soviet republics.

Still another former Soviet republic, the Kyrgyz Republic, is said by Marshall to house few atheists. The statistics mention 75 percent Muslim, 20 percent Russian Orthodox, and 5 percent other religious groups. There is no separate category of atheists who are counted as members of religious groups. But again, Barrett et al. put the atheist or nonreligious population in this former Soviet republic in 1995 at 29.6 percent, thus quite high.

Atheism has undoubtedly made an impact in the Islamic parts of the Soviet Union. Kazakhstan, with a religiously mixed population, and Uzbekistan, with a more purely Muslim population, seem to show this. But what about atheism in Muslim countries which have not been under Soviet influence? Let us have a look at some of these Muslim countries.

Available statistics (subject to all of the usual caveats) suggest that Bangladesh is 86.6 percent Muslim, with apparently very few atheists. Egypt is 87.5 percent Muslim, apparently with few atheists. Indonesia is 83 percent Muslim, and has a category of "other" of 1 percent, which probably accomodates atheists but also religious believers (see INDONESIA AND SOME OTHER ISLAMIC COUNTRIES, UNBELIEF IN). Iran has 99 percent Muslims and not more than a handful of other religious believers or atheists. Malaysia, with 58 percent Muslims, has a category "Sikh, animist, other" of 5 percent, and apparently few atheists.

Mauritania is more than 99 percent Muslim, with apparently at most a handful of atheists. Similarly, Morocco is 99.75 percent Muslim, with at most a handful of atheists. Nigeria is 45 percent Muslim, 40 percent Christian, and has a category of "other" of 6 percent. Pakistan is 93 percent Muslim, 7 percent other religious groups, and very few atheists. Saudi Arabia is 97 percent Muslim, about 3 percent other religious groups, and apparently very few atheists. Sudan is 70 percent Muslim, 19 percent Christian, 10 percent traditional religionist, and 1 percent "other or none." Turkey is 99 percent Muslim, with 1 percent other religious groups. Turkey often is claimed to defend a "secular" state which apparently does not include freethought.

Thus, in countries in which Islam is the predominant religion, there generally seem to be few atheists. As a whole, Islam has shown itself to be very resistant not only to atheism, but to all competing religions, including Christianity.

A remarkable exception, however, is Albania, a country not treated by Marshall. This country was predominantly Muslim (about 70 percent) until 1944. In the following years, after communists had taken power, religious believers were persecuted in savage ways. In 1967 all mosques and churches were closed for divine services, and during the period from 1967 until the end of 1990 it was prohibited to import and own religious literature.

The evidence relating to Mongolia is conflicting. Using Marshall as a source, it might seem that Soviet atheism has not had much influence. The population apparently has continued to be Tibetan Buddhist (95.5 percent). Tibetan Buddhism to a large extent represents Buddhist theory and practice as it had developed in India over the first fifteen hundred years of its existence. But according to Barrett et al., in 1995 Mongolia had 40.3 percent atheists or nonreligious. Whom are we to believe?

Although Buddhism is a religion which may be accomodating to atheism, this apparently is not always the case. So Burma (Myanmar), with 87.5 percent Buddhists, seems to have few atheists. Religious groups comprise 99 percent of all Burmese in official statistics, with a category of "other" comprising only 1 percent. Burma was in 2003 (and for many years before) ranked as one of the most repressive countries in the world.

In most Latin American countries, with Cuba and Uruguay as apparent exceptions, there seem to be few atheists (see LATIN AMERICA, UNBELIEF IN). Statistics present Argentina with a category of "other" numbering 2.5 percent; Brazil has a category of "none" with 3 percent. In Chile the category "none" accounts for 6 percent. In the case of Colombia, the "nonreligious" are lumped together with Mormons, Orthodox, and Jehovah's Witnesses, together comprising 2.1 percent. El Salvador has the category "none," 2 percent. Guatemala has the categories "other" and "none," each 1.5 percent. Mexico has the category "none," 3.5 percent. Yet Barrett et al. suggest that Uruguay in 1995 may have had 32.6 percent atheist or nonreligious.

Even though Marshall's *Religious Freedom* is in general not obviously erroneous, there are exceptions. A strange case is Sweden. If we are to believe Marshall's information, there would almost be no atheists in that country. However, according to studies of secularization this author carried out in the 1990s, in 1980 Sweden was already the most secularized of twenty-one Western countries, with 28.7 percent atheists or agnostics.

Another case is Norway. In a recent study of secularism in Norway, this author arrived at the result that at the end of the 1990s at least 10 percent of the population were atheists. The figure may be higher, but it hardly exceeds 30 percent. Yet according to Marshall, at the end of the 1990s only 3.2 percent of the Norwegians did not have any religion. This should be considered, however, in light of statistical studies of members of the Norwegian Lutheran State Church, which indicate that about 17 percent of church members are atheists.

On the whole, it is quite possible that persons who in various countries are counted as, say, Christian, Muslim, Jew, Hindu, or Buddhist, in fact are atheists. But it seems likely that North Korea, which according to official sources has 68 percent atheists, in fact has a much lower percentage of atheists.

Global trends. According to Barrett et al., in 1980 the global percentage of secularists was estimated at 20.8 percent. This was a significant rise from an estimated 0.2 percent in 1900. In the 2001 edition, the proportion of secularists worldwide as of 1995 was given as 15.6 percent. This represents a decline of 5.2 percent as compared to 1980. In 2000, according to Barrett et al., the global percentage further declined to 15.2 percent.

The decline of global atheism (in a wide sense) from 1980 to 1995 and 2000, if real, can perhaps partly be related to the breakdown of the Soviet Union in 1991. From 1988 on, the situation for religious believers in the Soviet Union improved after about seven decades of oppression or harassment. The same happened in a number of other countries which had been within the sphere of Soviet influence.

UNBELIEF AS A PROBLEM FOR THEISM. As a recent line of argument against the existence of God (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST) developed during the 1990s by J. L. Schellenberg and Theodore Drange, "unbelief as a probelem of theism" is closely related to what has been called "the problem of divine hiddenness" explored by, among others, Daniel Howard-Snyder and Paul K. Moser. If God exists and is perfectly loving, then why has he remained hidden from so many people, and why are there so many unbelievers? It would be expected that God would reveal himself clearly to people because it is in their best interest that he do so, and a perfectly loving deity would want what is in people's best interest. The problem is analogous to the problem of evil (see EVIL, PROBLEM OF). Just as a loving God, were he to exist, would probably prevent (or reduce) as much evil (i.e., suffering) as there is, so also he would prevent as much unbelief as there is. And so arise twin problems for theism: how to explain why there is so much evil (suffering) and why there is so much unbelief.

The problem can be pressed even more forcefully by way of an argument: Since a loving God would prevent unbelief, the fact that there are so many unbelievers constitutes good evidence that such a deity does not exist.

This is sometimes called the argument from nonbelief. This argument is especially strong when applied to the God of Christianity, who is supposed not only to love everyone, but also to want everyone to come to a knowledge of the truth (1 Tim. 2:4). The best explanation for the fact that so many people have not been made aware of (what Christians regard as) the truth is that the deity who is supposed to be all-powerful and to want that to happen simply does not exist.

Theists might make various attempts to solve (or get around) the problem of unbelief. Just three of them will be considered here: the free will defense, the afterlife defense, and the unknown-purpose defense.

The Free Will Defense (see DETERMINISM). The claim is made that God wants people to come to believe in him freely and not as the result of any sort of coercion. He knows that people who do not believe that he exists would indeed come to have that belief if he were to perform spectacular miracles. But for him to do that would overwhelm them and thereby interfere with their free will, which he does not want to happen. God's desire that humans retain their free will outweighs his desire to bring about universal belief, and that explains why he has not done things to make everyone a believer, which in turn solves the problem of unbelief.

One main objection to this is that people's free will is not affected by them being shown the truth, even by God. For one thing, people do not normally use their wills in the process of belief acquisition, but rather rely on the available evidence. For another thing, they want to know the truth, and therefore would not be forced against their will to acquire it if they were to be shown something. Assuming that God exists, for unbelievers to become aware of that truth would actually make them more free, for it would open up options to them that were not available before. There are a great variety of ways by which God might impart knowledge about himself, from performing miracles to inspiring humans to write scripture indicative of divine inspiration and then helping to disseminate knowledge of such scripture worldwide. It is counterintuitive to claim that God cannot do any of these things without interfering with people's free will.

It should be pointed out that in the Bible God is often described as performing miracles to get people to believe certain things, for example, before the Israelites and the Egyptians in order to demonstrate to them that he is the true God. Many other examples could be cited. Since God is supposed to have done those things, it seems that, contrary to the given defense, either such actions do not actually interfere with free will, or else God is not more concerned about free will than he is with people's unbelief.

Even if there were a conflict between God getting people to be aware of his existence and the preservation of their free will, God ought to prefer awareness to free will, because people would greatly benefit by coming to know how things really are. That would be especially true if one needs to have the right beliefs in order to get saved, a view supported elsewhere in the Bible (Mark 16:15–16; John 3:18, 36, 14:6; Acts 4:12). Even if it means interfering with unbelievers' free will, it would be far better for God to enlighten them, allowing them to be saved, than to permit them to remain unenlightened and thereby eventually damned. Furthermore, even if exclusivism were false and one need not be a believer in order to get saved, there would still be great benefits both to God (assuming he exists) and to the unbelievers if they were to become theists. They would get into a proper relationship with God, and, at least from a theistic perspective, they would come to see meaning in life and lose their depression and sense of alienation. They would be more likely to come to love and worship God, which would benefit him, since he is supposed to desire that greatly. According to most theists, it would also probably help people to be more moral and loving toward their fellow human beings. Thus, it might plausibly be argued from the theists' own viewpoint that there is greater value in people becoming aware of God's existence than in their completely retaining free will, assuming that it is not possible for both to obtain. Therefore, an all-loving God should want to enlighten the unbelievers even if that were to interfere with their free will, which further refutes the free will defense.

Still another objection is that there are well over a billion people on the planet who lack belief in God. Assuming that God wants all of them to come to have such belief, how does he expect them to do that if he is unwilling to provide the evidence they need? Does he expect them to come to have belief in some irrational manner? Theists may reply that there is evidence for the existence of God and thus theistic belief is in no way irrational. Advocates of the free will defense would add that there is just the right amount of evidence: enough to make theistic belief rational but not so much as to interfere with free will. If God were to provide still more evidence of his existence, no matter how slight, then that would cross the line and start interfering. However, the fact is that there really is no good evidence for God's existence and, furthermore, even if there were such evidence, apparently billions of people would be unaware of it and would be in need of something more. Presumably for God to provide that little extra would in fact not interfere with those people's free will, for it would only bring their level of awareness up to that of the theists who (with no interference with their free will) already are aware of the given evidence. Thus, there would be no good reason for God to permit unbelievers to remain that way. If there is a level of evidence sufficient for belief but less than that which would interfere with free will, then God should see to it that everyone is made aware of evidence for his existence at that level.

Many other objections could be raised, but from what has already been said it is clear that the free will defense will not work.

The Afterlife Defense. The claim here is that God plans

to enlighten unbelievers about his existence in the afterlife. If that were so, it would certainly get around the problem of unbelief. But what about salvation? Although most theists do not accept the idea that people can gain a second chance at salvation in the afterlife, some of them (e.g., Jehovah's Witnesses) do. Does the idea have any merit? There are of course excellent reasons to deny that an afterlife is physically possible (see IMMORTALITY, UNBELIEF IN; REINCARNATION), but let us disregard that here.

One objection, at least for some theists, is that the Bible conflicts with the implication that some people will meet the criteria for salvation only in the afterlife. The Bible says, "Now is the day of salvation" (2 Cor. 6:2) and "It is appointed for men to die once, and after that comes judgment" (Heb. 9:27). This requires that the criteria for salvation be satisfied in this life. Still other incompatibilities with the Bible and with doctrines of the Western church could be cited. At the very least, it seems that the afterlife defense conflicts with the religious views of most theists in the United States.

Another objection to the afterlife defense is that it would make many matters inexplicable. Why should God set up the world in such a way that there is a prior period when people are pretty much left on their own, followed by an afterlife period in which God reigns? What is the purpose of it all, especially if people can attain the most important goals of their existence, including satisfying the criteria for salvation, during the second period? Why even bother with the earlier period? If the earlier period has some significance, then it would seem that people who are in it ought to be able to attain whatever self-fulfillment is possible for them. But that would require that they become aware of the truth about God. Those who live their entire earthly lives ignorant of that truth would have missed out on something beneficial. The question is why God would permit that benefit (knowing the truth) to be withheld from so many people in this earthly life. The afterlife defense leaves all that not only unexplained, but inexplicable, and that is still another reason to regard it as unsatisfactory.

The Unknown-Purpose Defense. The last-resort defense is that God does have some purpose for permitting all the unbelief that there is, but it is unknown to humanity. Contrary to the afterlife defense, God does want to eliminate the unbelief here on earth, but there is something else that conflicts with that desire, something which he wants even more. If we were to learn what that "something else" is, then we would understand why God has permitted so many people to live their earthly lives without any awareness of his existence.

Whoever claims that a divine purpose exists which would explain why there are so many unbelievers in the world has a certain burden of proof to support that claim. If God exists, even if he does not want to tell us what his unknown purpose is, it would behoove him at least to tell us that he has such a purpose. But there is nothing whatever in scripture or elsewhere that would support such a notion. In contrast, there is excellent biblical support for the idea that God wants what is best for people and wants them to be aware of the truth, including the truth of his own existence. Thus, the unknown-purpose defense fails to meet its burden of proof.

Furthermore, an appeal to an unknown purpose is simply an appeal to mystery, which is antithetical to most theists' desire to explain the way things are. An appeal to mystery can never explain anything whatever, so it runs counter to any evangelical spirit or desire to spread the truth to others. That in itself is reason for theists to steer clear of it.

Another objection is that almost all theists take God to want his love for humanity to be reciprocated. But if God were to want people to love him, then it would be counterproductive (perhaps even irrational) for him to stay hidden from them. Although it is logically possible for God to have some (unknown) purpose which overrides his desire for people's love, the idea is nevertheless counterintuitive. Combine that with the earlier point that a loving God presumably wants whatever would benefit people in the long run, which would include knowing the truth. If God loves people greatly, then presumably he could not permit them to be so deprived. The appeal to the unknown-purpose defense again becomes increasingly far-fetched. There is intrinsic value to wisdom and to knowing the ultimate nature of reality. If God loves us, then he must want us to have that. Such considerations refute the unknown-purpose defense. There are other objections to it in addition to these.

Other defenses, in addition to the three considered here, could be constructed, but they too have been refuted, as by Drange. The overall conclusion on this topic seems inescapable: despite some efforts made, theists have not successfully solved or circumvented the problem of unbelief.

THEODORE DRANGE

UNBELIEF AS A WAY OF LIFE. Discussing the notion of unbelief as a way of life inevitably draws attention to what is meant by the word *unbelief*, not least because of the difficulties arising from how something defined negatively can also be a way of life. The first task is to

understand who is—and who is not—being spoken of when we speak of unbelief. In particular we need to distinguish between those who reject revealed religion in the name of some constructive, naturalistic worldview from those who are simply indifferent to all organized systems of belief, be they naturalist or supernaturalist. In the sense used here, *unbeliever* will refer only to the former group, while *indifferentist* will refer to the second group. Having made this distinction, the main problem with the idea of being an unbeliever becomes apparent, because this group, in contrast to the indifferentist, builds its identity around what it believes as much as what it does not believe. This, in turn, highlights the injustice of reducing *belief* to mere *religious belief*. This reduction is absurd and offensive, so for the purposes of this article, we shall now speak of unbelief as FREETHOUGHT and unbeliever as freethinker.

In the conclusion to *The Varieties of Religious Experience*, William James wrote: "The pivot round which the religious life, as we have traced it, revolves, is the interest of the individual in his private personal destiny. Religion, in short is a monumental chapter of human egotism." Paul Kurtz drew our attention to the same phenomenon when he spoke of the transcendental temptation, by which he meant the temptation to arrogate to ourselves a cosmic significance to which we are not entitled. Kurtz's public career has been about empowering people to reject the transcendental temptation in favor of his vision of an exuberant, dynamic HUMANISM. The core of freethought, then, lies in its willingness to reject the transcendental temptation. In making this rejection, freethinkers are rejecting what they see as a presumptuous belief that we, as individuals, are sufficiently deserving of a special corner of the universe to act as repository for one's immortal soul. The distinctiveness of freethought as a way of life arises from this rejection.

The first important consequence of freethought, in the sense of rejection of supernatural verities, is humility. If the motivating principle of religious life, as William James said, is human egotism, then the motivating principle of the freethinker's life is cosmic modesty. Bertrand RUSSELL gave classic expression of this understanding when he asked: "Is there not something a trifle absurd in the spectacle of human beings holding a mirror before themselves, and thinking what they behold so excellent as to prove that a Cosmic Purpose must have been aiming at it all along?" Russell was following in the tradition of Baruch de SPINOZA, who extolled the virtue of being able to acquire the perspective of *sub specie aeternitatis*, or "under the aspect of eternity." Similar sentiments can be found in the Taoist writings of China (see TAOISM, UNBELIEF WITHIN) and in some Indian philosophy (see INDIAN MATERIALISM, ANCIENT).

The achievement of a proper sense of cosmic modesty is a major part of the life journey for the conscientious freethinker. The more comprehensively this sense has been incorporated, the more firmly the transcendental temptation has been rejected. On this firm foundation freethinkers can then erect the framework of their lives. This framework will consist of three major qualities: altruism, toleration, and joie de vivre.

We have one life to live, and it is beholden on us to live that life to the fullest. And it is at this point that the freethinker parts company with the indifferentist. The indifferentist is likely to agree that we have only one life to live, but may then conclude that a life of hedonism is the only sensible conclusion to draw from that. Freethinkers, by contrast, recognize that in order to be consistent the egotism of hedonism needs to be rejected on much the same grounds as the egotism of personal immortality.

From this, the freethinker arrives at the value of altruism. This virtue is given its best voice in the notion of AGATHONISM, a refinement of the Golden Rule devised by the philosopher Mario Bunge, which says, "Live well and help others live well." One lives well by being the best person one is possibly capable of being; by loving as openly and disinterestedly as one is able, and being able to receive love in the same spirit. Affirmed in the love of a few people close to us, we can help others achieve satisfaction in their lives. This can be undertaken in any number of ways. As the Buddha said, right livelihood is an important component of right living. So the minimum requirement to helping others live well is to avoid noxious employments which add to the worldwide bankroll of suffering. More positive ways to help others live well may involve devoting time to the alleviation of suffering or to promoting excellence in others. The ways this can be done are limited only by one's imagination.

If freethought is defined first by cosmic modesty and next by altruism, the third consequence is toleration. In the absence of universalizing absolutes, and without the benefit of a supposedly infallible scripture to determine good from evil, freethinkers are faced with the challenge of working these values out for themselves. And with this human activity comes the possibility of error and the recognition that we can learn from others. In this way, toleration of others—other people and other ways and thoughts—is a necessary condition of freethought. Many humanist theorists have taken the next step by replacing the word *toleration* with *celebration*. Sometimes this can seem trite, but the thought behind it is valid. The existence of different people with different values, aspirations, and ways really is something to celebrate, not merely to put up with.

An important point about this is that the so-called unbelievers share some important features with believers. Both would agree that the life spent fashioning a coherent view of the world and seeking to live according to a set of principles is a worthwhile use of one's time. In this the freethinker and the believer have more in common with one another than with the indifferentist, who would be more likely to see such activity as a waste of time.

This does not mean, however, that freethought is some sort of substitute religion. To claim that reflects a presumption that only religion can provide the basis for a comprehensive worldview, clearly a false assertion. If the freethinker and the believer share the same priority given to the examined life, they part with respect to the conclusions they draw as to how this life should best be lived. At issue is the type of evidence each party gives weight to. Where the believer, particularly from the monotheist religions, gives primacy to faith, the freethinker is more impressed by REASON. It is not accidental that faith should have such an important role for the believer. The believer's focus is with the supernatural, however conceived, and no way to relate to the supernatural has yet been conceived that does not require the abandonment of reason. The freethinker's focus is with the natural world (see NATURALISM), and the principles of the natural world are best understood by our reasoning processes. The success of science is testimony to this truth. In the language of Daniel C. Dennett, it is the difference between cranes and skyhooks. Cranes are rooted firmly in the soil of naturalism while skyhooks hang precariously from some metaphysical trick with mirrors.

But the life of the freethinker is not defined solely by these rather somber virtues of humility, altruism, and toleration. Whereas the monotheist faiths are predicated on the suspicion that something is wrong with the world and with human beings, among those who have rejected the transcendental temptation the feeling is quite different. Life has its joys and sorrows, and each is doubly sweet because of the knowledge that our life will come to an end, and that end is permanent, final, and irrevocable. For the followers of the monotheist faiths, life is a vale of tears where they are tested, with the usual proviso that they will be found wanting in some basic way. Everything is a preparation for death, and what is supposed to happen after it. The contrast with the freethinker can hardly be more stark. The freethinker's attitude to life is joyful and exuberant. From Democritus, known as laughing philosopher, to *Monty Python's Flying Circus*, the freethought tradition has cherished the humor in life. In refusing to take ourselves too seriously, freethinkers leave room for the simple everyday joy of living.

So far we have distinguished the ways of life between believers and freethinkers as well as between freethinkers and indifferentists. But useful distinctions can also be drawn within the various branches of freethought. The English sociologist Colin Campbell has discerned two contrasting styles. On the one hand are abolitionists, who generally have a more combative relationship with religion. Abolitionists see the error and the exploitation in religion and see religion as a something that needs to be struggled against. The substitutionist, by contrast, has a more benign attitude toward religion and is more concerned to re-create in freethought some of the pleasanter features of religion: a sense of belonging and shared purpose. People whose transition from religion to freethought has been traumatic are more likely to be abolitionist in approach, whereas people whose transition from religion was less painful, or who have never been religious, are often more inclined to take the substitutionist path. Whichever of these orientations one prefers helps determine which freethought organization one chooses to belong to. It has been an ongoing challenge for freethought organizations to successfully represent both strands within their membership. Substitutionists are inclined to become impatient with what they see as endless discussions about the nonexistence of God or scriptural contradictions, while abolitionists can be equally unwilling to indulge in what they see as playing at wannabe religion.

We can see, then, that the freethinker shares important traits with the religious believer, most notably a commitment to finding answers to questions many see as unanswerable or even irrelevant to the enjoyment of life. But if they agree that the questions are worth asking, freethinkers and religious believers disagree on the answers they reach. The freethinker's rejection of the transcendental temptation leads to an enhanced love of life.

The value of the freethinkers' way of life can be inferred by looking at their constructive role in society. It has been a staple of the more reactionary brands of religious apologetics that freethinkers cannot be, or, at least find it difficult to be, moral citizens. The truth, of course, is quite the opposite. The people who have traditionally been deemed unbelievers are among the best educated, most productive members of society. The percentage of freethinkers (as opposed to indifferentists) in prisons is minuscule. And freethinkers frequently show up in psychological studies as being less encumbered by dispositions to an authoritarian personality than is usual. Freethinkers, as a general rule, have above-average levels of education, hold down responsible jobs, and are active, productive members of society. The way of life of the freethinker is characterized by cosmic modesty, love of life, altruism, toleration, and joie de vivre. These characteristics help make freethinkers valuable members of society.

BILL COOKE

UNDERWOOD, BENJAMIN FRANKLIN (1839–1914), American freethought lecturer, author, and editor. The second of seven children, Benjamin Franklin Underwood grew up in Westerly, Rhode Island. He received a modest education, but read voraciously in science and philosophy. In 1862 he married Sara A. Francis, later a prominent suffragist (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF), while convalescing from a wound suffered in the US Civil War. His journalism career began in 1863, when he served while on active duty as war correspondent for the *Newport (RI) Daily News*.

After the war Underwood worked as a librarian, lecturer, essayist, and medical doctor. He was the official surgeon of the John Wood Post, Department of Illinois, Grand Army of the Republic, and authored an 1882 medical book on childhood diseases.

By the early 1870s, Underwood's reading and experience had led him to an unflinching materialism (see MATERIALISM, PHILOSOPHICAL) and a fervent embrace of Charles DARWIN's theory of evolution (see EVOLUTION AND UNBELIEF). He won prominence as a pamphleteer and debater, challenging clergymen across the eastern United States. He toured extensively, visiting most large cities in the American East and Midwest. Unlike his contemporary Robert Green INGERSOLL, the "Great Agnostic" (see AGNOSTICISM), Underwood's philosophy began with a no-holds-barred scientific account of the natural world, from which ATHEISM inevitably followed. In this, Underwood's philosophy resembled the atheism of England's Charles BRADLAUGH.

Underwood published numerous lectures and tracts, mostly through the Truth Seeker Company (see *THE TRUTH SEEKER*), founded by DeRobigne M. BENNETT. In 1880 Boston's Free Religious Association (see HUMANISM) invited Underwood to coedit what would become a noteworthy freethought paper, the *Index*, which he did for seven years. In 1887 Underwood moved to Chicago, briefly editing another long-lived freethought journal, *Open Court*.

Underwood's interests then turned away from freethought, toward mainstream journalism and toward spiritualism (see SPIRITUALISM AND UNBELIEF). He became secretary of Chicago's Psychical Science Congress; in 1896 he and his wife published a spiritualist book, *Automatic or Spirit Writing*. Despite these excursions from his erstwhile materialism, Underwood chaired the Congress of Evolution at Chicago's Columbian Exposition of 1893.

In 1897 Underwood moved to Quincy, Illinois, where he joined the *Quincy Daily Journal*, soon becoming its editor. He held that position until 1913, retiring to his childhood home of Westerly, Rhode Island, where he died on November 10, 1914.

TOM FLYNN

UNION RATIONALISTE. The Union Rationaliste (UR) was founded in France on March 30, 1930. It aims at the defense and promotion of the spirit and the methods of science among the public at large. At once it was recognized as serving a real need, attracting the involvement of scientists of high stature, intellectuals, and citizens of diverse interests. Its first president was Henri Roger, MD. Paul Langevin, the well-known physicist, was founding vice president, and Albert Bayet the general secretary. The director of publications was the surrealist poet Philippe Soupault.

The UR's activities quickly multiplied. Public lectures were offered (already in 1930, notable lectures by Paul Langevin on science and determinism). In January 1931, the first issue of the UR journal *Les Cahiers Rationalistes* (*CR*) appeared. By April 1937 the UR had 1,260 members, including several outside France. Regional sections were created in France and abroad, including one in Mexico. A publishing company, Éditions Rationalistes (ER), was launched in 1936.

Until 1940 the UR was concerned primarily with the relations between science and moral values. Noteworthy publications include Albert Bayet's *La morale de la science* and Henri Roger's *Religion et Rationalisme*. Paul Langevin, elected UR president in 1939, published a lucid if somewhat pessimistic analysis in a paper titled *Science as a Factor of Moral and Social Evolution* published in *CR*. But then the war exploded. The Nazis arrested Langevin in October 1940. The UR became dormant until 1944. After French liberation, Langevin returned as leading officer of the UR, looking forward now to better prospects for the UR and for humankind. One token of his recovered optimism is the conclusion of his introduction to a talk by Fréderic Joliot-Curie: "A reason for us to be confident in the future is the extreme youth of mankind."

The presidents of the UR after Langevin were the aforementioned Joliot-Curie, physicist and Nobel laureate (1946–55); historian of religion Prosper Alfaric (1955); mathematician Albert Châtelet (1955–60); chemist Charles Sadron (1960–68); biochemist Ernest Kahane (1968–70); astrophysicist Evry Schatzman (1968–2001); then (after a change in the UR's bylaws),

mathematician Jean-Pierre Kahane (2001–2004) and physicist Hélène Langevin (2004–).

The UR's activities developed in various directions during the fifties and sixties. To the *CR* was added in 1953 the *Courrier Rationaliste*. The UR then had 5,690 members and fifty-one regional sections organizing local meetings and lectures. *CR* had come into its own as a rich journal of ideas. ER was transformed into NER (Nouvelles Éditions Rationalistes).

Several lines of thought are easy to distinguish in UR activism during this period.

The first line concerned the problems of *Laïcité*, and of probing the history of religions. Alfaric's *De la foi à la raison* (From Faith to Reason) was published in 1959. Several other books along this line (including books aimed at children) were published by G. Fau, J. Rennes, E. Kahane, and Jacqueline Marchand.

The second line concerned the paranormal and the fight against false science and pseudoscience. In 1965 a pernicious movement was blooming in France: Planète was a strange and murky but very powerful organization that published several journals in the wake of the best-selling book that launched the movement, *Le Matin des Magiciens* (The Morning of the Magicians), by Bergier and Pauwels. The UR reacted vigorously by publishing several papers and books critical of paranormal phenomena, extraterrestrial fantasies, astrology, and other forms of irrationality. In particular, its journal *Crépuscule des Magiciens* (The Dusk of the Magicians), presented in the same format as the Planète movement's flagship journal, became a popular success.

The third line, the presentation of science and scientific methodology, remains the axis of the UR's activity. Books offering a scientific view of the origin of life were published beginning in 1955. ER published some fifteen books along this line, in particular the comprehensive five-hundred-page *Dictionnaire Rationaliste* in 1964, whose stated purpose was "to show on some well-chosen topics the scientific method in action."

In order to develop its ideas in a deeper way than in the mass-audience *CR* or in the *Courrier*, which was gradually disappearing, in 1967 Victor Leduc created a new journal, *Raison Présente* (Reason Today), published by NER. In later years the *Courrier* would be replaced by an Internet Web site.

The period between 1970 and 2000 is marked by the strong personality of UR president Evry Schatzman, who extended the range of the UR's activities by steering greater concern to social sciences and the humanities. This was also necessary because new media had emerged that were doing a good job of popularizing the sciences on a level beyond the capacity of the nonprofit UR. More prominence was given in UR publications to philosphical reflection.

But this period also saw the rise of new forms of irrationalism, in particular the New Age movement. Increasingly the UR responded to the need to fight against that and other new forms of pseudosciences that hid behind spiritual pretenses. The CFIPP (French Committee for the Study of Paranormal Phenomena) was created by the UR under the leadership of physicist and Nobel Laureate Alfred Kastler and astronomer Jean-Claude Pecker. As a newborn brother to the Belgian Comité para and to the American CSICOP, it had engaged in a small number of strong protests before it was eclipsed by AFIS (French Association for Scientific Information), a sibling association of UR. AFIS published the journal *Science and Pseudo-Sciences*, led by journalist and UR activist Michel Rouzé, its first president, followed by J.-C. Pecker (2001–2002) and Jean Bricmont (2002–2004).

The UR developed its international connection early, starting at the creation in 1948 of the International Humanist and Ethical Union (IHEU). The IHEU was launched by the very founders of UNESCO, Bertrand Russell and Thomas H. Huxley. Given that the UR is based in Paris, UR members often take the lead in representing the IHEU at the UNESCO General Assemblée. In addition, they often act as representatives and spokespersons of other international bodies.

The UR boasts a proud tradition. It continues to pursue the goal first defined by Paul Langevin, to model its actions on the example of scientific inquiry, to illustrate the role of scientific research in confronting the great challenges facing humankind, and to keep permanently in view the human march toward a conscious maturity.

Jean-Claude Pecker

UNITARIANISM to 1961. Closely defined, Unitarianism means belief in one God and in Jesus as his human prophet. However, other unorthodox positions on the nature of God and the relationship between God and Christ, such as anti-Trinitarianism, Arianism, Adoptionism, and Sabellianism contributed to Unitarianism's development and are often included with it. According to church historian Earl Morse Wilber, Unitarianism was characterized by freedom, reason, and tolerance; it stressed ethics over doctrine. Additionally, Unitarians displayed strong interest in science and education. By 1961 the American Unitarian Association tended toward humanism. In that year it merged with the Universalist Church (see Universalism to 1961) to form the Unitarian Universalist Association (see Unitarian Universalism).

One major figure in the rise of Unitarianism was the Spaniard Michael Servetus, martyred in 1553 in Geneva, Switzerland. His writings against the Trinity influenced the Unitarian movement, which would emerge in Renaissance and Reformation Italy. Italian refugees settled in Poland and Transylvania. After the Polish Brethren, a sect holding Unitarian beliefs, was destroyed during the Counter-Reformation, refugees fled to the Netherlands and Transylvania. Unitarian churches

remain to the present day in Romania and Hungary. Publications from Unitarians in the Netherlands influenced dissenters in the British Isles.

North American Unitarianism developed more or less independently out of Puritan Congregationalism, which stressed learned study and permitted diversity of doctrine. The oldest Puritan congregations became Unitarian, as well as the Separatist Pilgrim Congregation at Plymouth. The first New England Episcopal church, King's Chapel, also became Unitarian by affirming one God and a humanitarian Christology. King's Chapel and some other churches had contact with the British movement, whose "trust deed" chapels similarly were not required to embrace specific doctrines. Philosopher John LOCKE, who wrote the much-admired 1685 *Letter concerning Toleration* and whose theological views after his death would be revealed as anti-Trinitarian, influenced groups in North America and the UK. Among the founders of the United States, Thomas JEFFERSON and John Adams embraced Unitarian theology. There is evidence that James MADISON held similar beliefs. Other noteworthy figures influencing Unitarian thought include Jeremy BENTHAM and John Stuart MILL, who collaborated with his Unitarian wife, Harriet Taylor Mill, on most of his works.

In America and the UK, groups holding Unitarian beliefs were reluctant to tie themselves to the sectarian name. North American Congregationalists held an Arian theology, viewing Christ as superhuman but not equal with God. Their leader, William Ellery Channing, eventually developed a humanitarian Christology, viewing Jesus as less an angelic mediator than a remarkable human teacher. Human dignity was one of Channing's key concepts. In the United Kingdom, many holding Unitarian views were reluctant to name congregations for a doctrine, preferring to be known as Presbyterian, a label that described only their form of governance.

Later in the nineteenth century, the Higher BIBLICAL CRITICISM and German Idealism influenced Unitarians in North America and the UK. Ralph Waldo EMERSON was the primary American philosophical leader; James Martineau played this role in the UK. While congregations in Hungary and Romania remained close to their Protestant origins, in the United States the Western Unitarian Conference (organized in 1852) and the Free Religious Association (FRA, 1867) widened the scope of the movement after the US Civil War. In addition to Unitarians, the FRA embraced Reform Judaism's Isaac Mayer Wise and also Felix ADLER, the founder of ETHICAL CULTURE. There was also an interest in Eastern religion: Unitarians played a significant role in the 1893 World Parliament of Religions at the Columbian Exposition. The FRA's journal the *Index* was finally absorbed by Open Court, a significant philosophical publisher.

In both the United States and the UK, Unitarians made many contributions to social reform. Among these were woman suffrage; civil service reform; care for the poor, the blind, and the mentally ill; and humane treatment of animals. Unitarians supported the abolition of slavery, although not unanimously. After the American Civil War, they contributed financial help to freed slaves and Southerners. Significant Unitarian reformers included Harvard's Francis Greenwood Peabody, a major voice for the Social gospel, as was John Haynes Holmes during the first half of the twentieth century. Jenkin Lloyd Jones, from a Welsh Unitarian family, founded Chicago's Abraham Lincoln Center, a Unitarian contribution to the institutional church and social settlement movement. In the UK, Charles Dickens, whose novels stirred interest in the poor and efforts at reform, attended a Unitarian congregation when one was available where he lived.

In 1940 a Unitarian Service Committee was founded in the United States. It aided refugees from Nazi-occupied Europe including the non-Unitarians Franz Werfel, Heinrich Mann (Thomas Mann's brother), and Arthur Koestler; it also supported Albert Schweitzer's African jungle hospital. Schweitzer had long-term connections with Unitarians and sympathized with humanism; later—in 1961, the year when the Unitarians and the Universalists merged—Schweitzer joined the Church of the Larger Fellowship, a "church by mail" for Unitarians far from established congregations.

Unitarianism's lack of a creed and its stress on the humanity of Jesus and human dignity led eventually in a humanist direction in the United States. The 1933 Humanist Manifesto continued this inclusive trend. The first draft was written by prominent philosopher Roy Wood Sellars. Other important influences included PRAGMATISM, two of whose principal exponents, William James and John DEWEY, were involved with Unitarian congregations. Among other trends were Process Theology, the philosophy of Alfred North Whitehead (1861–1947) and others that stressed becoming over being and equated God with the cosmic Process; and the social ethics of James Luther Adams, interpreter of Paul Tillich, who saw Christ as the ideal human. Nevertheless, humanism became the predominant theological position.

UNITARIAN UNIVERSALISM. By 1750 the forebears of Unitarians and Universalists were agreed on several things—human reason was the best way to reach truth, God's goodness precluded eternal punishment, and the dogma of Trinity was neither reasonable nor biblical. Their denominations came to dominate Harvard, founded St. Lawrence and Tufts, and ordained women ministers. In terms of contemporary Western culture, even in the experimentalist United States, these constituted major unbeliefs. Influenced by comparative religion, adventurous members founded the Free Religious Association, the World Parliament of Religions, the International Association for Religious Freedom—all respectful ways of becoming involved with liberals from other traditions.

Continuing shifts away from the religious mainstream created naturalistic and humanistic theologies, and Unitarians and Universalists predominated among the drafters and signers of the Humanist Manifesto of 1933 (see HUMANISM). Full merger came in 1961 as the Unitarian Universalist Association (UUA), and a 1966 survey showed that the majority of members were clearly post-Christian and posttraditional, as well as highly educated and economically strong. The new denomination pioneered in welcoming members of diverse sexual orientations, in funding movements of black empowerment, and in involving women in all structural levels. Participation in civil liberties and other liberal causes remained high. Innovative educational materials for youth were a high priority.

Historically, neither group had used creeds, but most of their members had grown up elsewhere and had therefore consciously chosen this distinct form of post-Christian, posttraditional new religiosity. The rightward shift of US culture after the 1960s was bound to affect all religions. Evangelical Protestants used the politicians' "Southern strategy" to advance their own claims to dominance; mainstream Protestantism and Catholicism lost members; and many Americans, including new immigrants, were drawn into Pentecostal or charismatic movements and megachurches. As it became clear that membership growth was lagging, UUA denominational priorities shifted toward a pluralism and inclusiveness that stressed that all beliefs were welcome. The UUA adopted and still highlights seven principles that are liberal, general, and quite inclusive.

The onetime humanist trajectory is now challenged by new caucuses—Buddhist, Christian, feminist, and pagan. This new diversity has been strengthened by a steady supply of clergy who have been trained in other denominations and who may have selected Unitarian Universalism for other-than-theological reasons, not to identify with this particular religious history. If unbelief means "believing differently," Unitarian Universalists may be losing their distinctiveness. Their new competition now consists of broadly spiritual movements, Eastern spiritualities, Unity, and Science of Mind. A 2005 banner from UUA headquarters puts this clearly: "Room for different beliefs. Yours."

ROBERT B. TAPP

UNITED KINGDOM, UNBELIEF IN. Early unbelief in the UK was characterized by suppression and oppression. It was prudent for unbelievers to keep their views covert or to cloak them in moderating ideas, such as DEISM. Overt ATHEISM does not appear in print until the late eighteenth century, but there were earlier skeptical sallies during the English Renaissance and a ferment of confused but doubting ideas in the period of the Restoration of the monarchy after the Civil War and Cromwell's rule.

Early Skepticism. Sir Walter Raleigh was accused of atheism, but it was never substantiated. His book based on the work of Sextus EMPIRICUS, *The Skeptick*, at least suggests acquaintance with questioning ideas. Christopher Marlowe's plays (see ENGLISH LITERATURE, UNBELIEF IN) indicate strong antireligious views. The essayist Francis Bacon, in his essay *Of Atheism*, attacks atheism but confirms that such ideas were around to be criticized; his discussion of the extension of knowledge and the method of science were important forerunners for the development of science and the *encyclopedists* (see ENLIGHTENMENT, UNBELIEF DURING THE).

Two major thinkers in the seventeenth century were Thomas HOBBES and John LOCKE. Hobbes was reputed to be an atheist but never said so, although his major work of political thought, the *Leviathan*, contained hostility to church power and some clergy claimed that God's wrath at Hobbes's unbelief had caused the Great Plague and the Great Fire. Covert atheism was obviously in the air, given the need felt by the government to draft two acts against irreligion in 1666–67 and 1677–78.

The title of John Locke's classic work *A Letter concerning Toleration* (1689), which influenced VOLTAIRE, speaks for itself as an important precursor of FREETHOUGHT; but he did not extend toleration to those "who deny God" particularly because their bond or oath on the Bible could not be trusted. He was friendly with scientists such as Boyle and concerned with the scope of reason.

A pupil of Locke's was the third Earl of SHAFTESBURY, a benign man who believed in human and universal beneficence. Shaftesbury was a leading influence on the English deists who were so important in the first half of the eighteenth century. They displayed the constant denial of unorthodoxy alongside a constant iteration of deistic and non-Christian beliefs. J. M. ROBERTSON wrote of the "distribution of heretical views among the nominally orthodox, and of orthodox views among the heretics." Deists believed in a God who did not intervene in human life; theists lay more emphasis on God as a force of nature (see also PANTHEISM AND UNBELIEF).

Deistic Thought. Bishop Berkeley wrote of an "execrable fraternity of blasphemers in Dublin." John TOLAND was one of them. He was influenced by his study and sojourn in Holland—an important source of ideas of tolerance and skepticism. His *Christianity Not Mysterious* (1696) examined the truth of the Bible and offered a naturalistic view of religious mysteries. The book was ordered to be publicly burned in Dublin. It may be thought that some deism was a prudent move toward godlessness. But for others it was a legitimate philosophic approach to God.

Anthony COLLINS is thought by David Berman to be a speculative atheist, perhaps the first "strong-minded atheist." His most famous book, the *Discourse of Freethinking*, created an uproar after which he fled to Holland. Later works by him doubted the reliability of prophecy. Thomas WOOLSTON, a sober and earnest man like most of the deists, speculated that biblical stories were myths. Matthew TINDAL, who wrote *Christianity as Old as Creation* (1730), was fully theistic but anticlerical (see ANTICLERICALISM). Conyers MIDDLETON remained as a clergyman and academic: he withdrew from early skepticism, but toward the end of his life produced *A Free Inquiry into Miraculous Powers* (1748).

The politician and Tory Lord BOLINGBROKE in retirement wrote skeptical works that influenced the deist poet Alexander Pope (See ENGLISH LITERATURE, UNBELIEF IN). Bolingbroke's skeptical works were not published until after his death, which led the devout Dr. Johnson to say that Bolingbroke had charged the blunderbuss against religion and morality but "had no resolution to fire it off himself." The English deists let forth many shots against orthodox religion, provoked a wide public debate, and took an important step toward later full-blown freethought.

Philosophic and Historical Atheism. David HUME and Edward GIBBON—respectively, a philosopher and a historian—were two major skeptics of the eighteenth century. Hume was a Scotsman and part of the brilliant efflorescence of thought that was the Scottish Enlightenment. His writings did much to undermine the idea of God as First Cause (a deist position), his writing *On Miracles* demolished the idea that events contrary to nature took place, and his posthumous work *Dialogues concerning Natural Religion* presented an ironic view of the arguments against the existence of God. Hume was amazed, on an occasion when he visited France and dined with a group of philosophes, to be told that he was supping with atheists.

Gibbon's masterpiece *The History of the Decline and Fall of the Roman Empire* (1776–87) was a history from which the role of God had been removed. Gibbon's chapters on the rise of Christianity outraged clerics because they accounted for the religion's growth purely as a historical phenomenon without invoking the divine power of God. He wrote in his *Autobiography*: "The present is a fleeting moment, the past is no more, and our prospect of futurity is dark and doubtful." Gibbon also thought the consequences of the French Revolution would be dark and doubtful. Atheism at the upper echelons of society was found in that stern opponent of French post-Revolutionary hostility, Pitt the Younger. The poet from aristocratic origins, Percy Bysshe SHELLEY (see ENGLISH LITERATURE, UNBELIEF IN), wrote and published one of the earliest completely atheist pamphlets, *The Necessity of Atheism.*

Freethought became divided between growing working-class radicalism and higher-class intellectual debate. Joseph PRIESTLEY and Erasmus Darwin were Unitarian deists (see UNITARIANISM TO 1961) whose participation in scientific and cultural discussion clubs marked an important development. Meanwhile the working classes suffered for their freedom of thought

and expression. Peter ANNET, for instance, attacked theology in a fiery tone and considered the problem of why God favored the immoral David of the Old Testament. He published nine issues of the *Free Inquirer* in 1761, which especially attacked the authenticity of biblical history. He was tried for BLASPHEMY in 1763, when he was in his seventies, convicted and pilloried twice, imprisoned for one year, and forced to endure one year's hard labor.

Thomas PAINE was a thinker and activist who took part in the American and French revolutions. His *Rights of Man* (1791–92) was one of the first major defenses of the right of all people to just government, legal justice, and fair distribution of wealth—such ideals were often linked with radical freethought. His *Age of Reason* (1793–94) was written largely while he was living in revolutionary France (barely escaping the guillotine). By the end of the eighteenth century his deism was rather old-fashioned, but his attack on Christianity was devastating. Paine took the Bible to pieces—and it was never really put together again. Paine's influence on radical freethinkers was enormous. He opposed censorship, but his work suffered from it.

Richard CARLILE was a self-educated publisher imprisoned for publishing *The Age of Reason*. He developed his ideas while in prison, and wrote in a pamphlet, *Address to the Reformers:* "I advocate the abolition of all religions, without setting up anything new of the kind." This became the task of the nineteenth-century thinkers and activists. Carlile was important for the completeness of his atheism, for his struggle against censorship, and for his attempt to develop organizations such as Free Inquiry and the Zetetic Societies—a crucial innovation for the nineteenth century. His partnership with Eliza SHARPLES strengthened their activities.

Jeremy BENTHAM was a key philosopher, as was John Stuart MILL, the son of Bentham's friend James Mill. Bentham's utilitarianism, with its catchphrase "the greatest happiness of the greatest number," was part of the process of separating ethics from theology that would be pursued through to such twentieth-century thinkers as G. E. MOORE and A. J. AYER. Bentham was never overtly atheistic, but was very critical of religion, especially in *Analysis of the Influence of Natural Religion on the Temporal Happiness of Mankind* (1822), which was published under the pseudonym of "Philip Beauchamps." It attacked the "Jug" (juggernaut) of the church. John Stuart Mill modified some utilitarian principles; he displayed no animosity toward religious thinking but rather a tendency toward a "religion of humanity." His *Three Essays on Religion* were published posthumously; they considered the "utility" of religion rather than its truth. A friend of Bentham and of James and John Stuart Mill was George Grote, the distinguished historian of ancient Greece. His atheism was covert but, as indicated by his personal notebooks, distinct. He was a founder of University College, London, an institution which declined to sustain the religious requirements of other English universities.

Countertheology. The criticism of theology and the Bible moved apace through the nineteenth century. A new translation of the Bible in 1793 by Alexander Geddes, a Scottish Catholic, dated the Pentateuch (the first five books of the Bible, traditionally held to have been written by Moses) from the time of King Solomon. Further study was to throw the biblical chronology out of kilter, from internal deduction and later from historical research. German scholars pioneered the study of the New Testament, suggesting that authorship and dating were doubtful. E. B. Pusey's *An Historical Enquiry into the Probable Causes of the Rationalist Character of Germany* (1826–30) transmitted questioning of the Bible to Britain. H. H. Milman's *History of the Jews,* published anonymously in 1829, shocked readers by its insertion of historical factors into the study of a religious group.

A major German influence was the *Leben Jesu* (Life of Christ, 1835) by David Friedrich STRAUSS. It was intended as a work of history, not hagiography, and the gospel was to be "tried by the tests of science and consistency, in which all miracle was to be regarded as unhistorical and all vital contradiction as decisive against credibility" (J. M. Robertson). An English work published a little later, but without knowledge of *Leben Jesu*, was Charles Hennell's *An Inquiry concerning the Origin of Christianity* (1838), which was the first study of the religious works as historical documents. Wider knowledge of Strauss's seminal work came with the translation by Marian EVANS, later George Eliot (see ENGLISH LITERATURE, UNBELIEF IN).

A major work of countertheology was *Essays and Reviews* (1860), a collection of essays by seven clerics, all demonstrating the cumulative effect of critical religious studies in the first half of the nineteenth century.

Science. It was not just the many new scientific discoveries and theories that changed nineteenth-century thought, but the increasing understanding of the scientific process. The mathematician and freethinker William Kingdon CLIFFORD wrote in his lecture "On the Aims and Instruments of Scientific Thought": "The subject of science is the human universe, that it is today, everything that is, or has been, or may be related to man."

Charles DARWIN is the giant whose theory of evolution changed all thinking about the development of the earth and its species—in such a way that it was impossible to believe in the divine creation of Genesis (see EVOLUTION AND UNBELIEF). Before him came the geologist Charles Lyell, whose geological studies changed the understanding of the age and development of the earth. Darwin's theory as presented in *On the Origin of Species* (1859) was especially influential in suggesting that the development of species was continuous from primitive life through mammals and primates to man. This was heatedly challenged. Charles Kingsley wrote in 1863 that "Darwin is conquering everywhere, and rushing in

like a flood, by the mere force of truth and fact." Darwin never rushed to conclusions and held quiet agnostic views (see AGNOSTICISM).

The man who coined the word *agnostic* was Thomas H. HUXLEY, known as "Darwin's Bulldog"; he did much to spread a detailed understanding of evolutionary theory. He was combative and part of that fiercely fought battle between science and religion (see RELIGION IN CONFLICT WITH SCIENCE)—despite the fact that some of the religious were beginning to embrace scientific discoveries. The title of John William DRAPER's book, *History of the Conflict between Religion and Science* (1874), sums up one aspect of the debate. Some followers of Darwin, such as Herbert SPENCER and Ernst HAECKEL, though not Darwin himself, developed a kind of social Darwinism which saw humanity evolving ever forward. This was attractive to those many freethinkers who anticipated the inevitable progress of humankind as religion withered away.

The literary and philosophic output of the nineteenth century pointed to the slow acceptance of a secular approach. Literature (see ENGLISH LITERATURE, UNBELIEF IN) showed the fine novelist George Eliot giving a picture of the way in which people find meaning and morality in their lives, while Thackeray shows how the hedonistic and moralistic sit side by side in a secular world. The poets Matthew ARNOLD and Robert Browning showed the struggle with belief in their poetry. Algernon Charles SWINBURNE and James Thomson wrote poetry in which pessimism and perversion were given play as part of human experience.

In a period that in Britain was not strong on philosophy, British philosophers were very concerned with ethics. Henry Sidgwick wavered in all directions, but never abandoned his concern with secular ethics. He renounced his academic post—something that many "without believing more than he did" refrained from doing. Spenser adopted the sociological approach. The influence of Auguste COMTE was passing, but his misty view of an agnostic social religion had some influence. That an eminent judge, Sir Justice James Stephen, should offer overt atheism was a sign of the times. He ridiculed the Comtist view of a social religion—"we can get on very well without religion." His brother, the literary figure Leslie STEPHEN, wrote *An Agnostic's Apology* (1876); in addition, he and Francis Newman (the agnostic brother of Cardinal Newman) conducted a vigorous campaign for secular education. A less well-known figure, whose writing survived among a readership of working-class freethinkers, was Winwood Reade. His *The Martyrdom of Man* combined anthropological and historical research in an account of Africa, which shifted the perceived center of civilization away from Europe. Reade was perhaps expressing a view held at the intellectual and popular level of unbelief: "To develop to the utmost our genius and our love—that is the only true religion."

Popular Freethought. Robert OWEN held utopian socialist views, and is best known for his contribution to the Co-Operative movement. He "abandoned all belief in religion" and replaced it with a sense of "universal charity." Early secularists (see SECULARISM) such as George Jacob HOLYOAKE were influenced by the Owenite movement, but moved away from its attempt to set up ideal communities. Owen believed that upbringing and environment could change people and society. Some followers believed that rejecting religion could equally bring improvements to society as a whole.

The founding of the NATIONAL SECULAR SOCIETY (NSS) in 1866 was a key moment in the development of overt and largely working-class freethought. Charles BRADLAUGH was its first president, and dominated the society until the 1890s. Bradlaugh struggled to take the oath to enter Parliament but was not allowed to do so, since he could not swear on a Bible he did not believe in. In this process he was rejected from Parliament on several occasions. His struggle to enter Parliament enhanced his reputation among unbelievers at all levels of society. The journals the *NATIONAL REFORMER* and the *FREETHINKER* chronicled the events and ideas of the movement. Both George Jacob Holyoake and George W. FOOTE were tried and imprisoned for blasphemy—and abolition of the blasphemy law remained an ambition of the movement. Republicanism, the campaign against the hereditary monarchy, was espoused by many secularists—particularly during the 1870s, when Queen Victoria was so unpopular. Support of neo-Malthusianism, or birth control (see BIRTH CONTROL AND UNBELIEF), was a cause of conflict among secularists. The need to develop secular education and the need for self-education were constant themes. Later in the nineteenth century there developed differences between those who espoused the new doctrine of socialism (see SOCIALISM AND UNBELIEF) and those who preferred to remain with liberal individualism.

The SOUTH PLACE ETHICAL SOCIETY held regular Sunday meetings, and in W. J. Fox had one effective intellectual leader, followed by another: Moncure CONWAY. Debates on DARWINISM, Comtism, philosophy, and literature were the lifeblood of the society. Ethical movements (see ETHICAL CULTURE) developed later in the century, partly in direct influence from the United States. It was a constant theme that ethical values were not lost when religion was discarded.

Toward the end of the century the RATIONALIST PRESS ASSOCIATION (RPA) was founded (1899) with the intent of publishing books on rationalist themes at a price which could be afforded by all. The RPA thus bridged the intellectual and popular levels of nineteenth- and twentieth-century unbelief.

Twentieth Century. The philosophical climate of Britain in the twentieth century was set by three atheistic/agnostic thinkers: G. E. Moore, John MCTAGGART and Bertrand RUSSELL. Moore, who importantly grounded ethics in the nonreligious world, wrote an

essay "The Value of Religion" in which he rejected arguments for the existence of God. McTaggart in *Some Dogma of Religion* (1906) and *The Nature of Existence* (1921 and 1927) proffered a more assertive atheism: but his belief in immortality and defense of Anglicanism—though he was simultaneously a member of the RPA—made his atheism less well known. Bertrand Russell wrote two popular essays, *Why I Am Not a Christian* (1927) and *What I Believe* (1925), which exerted enormous influence. His pacifism, defense of nuclear disarmament, and popular essays made him a humanist favorite and a president of the RPA.

Unbelief had become more confident, and as the century progressed became the major undercurrent of thought in many spheres. Anthropology was used to give a rational explanation of religious practices (with James Frazer a respected, if now outdated, figure). Sigmund FREUD proposed the importance of the unconscious mind to our beliefs and the position of an internalized father figure as a reason for belief in God. His *The Future of an Illusion* (1927) aptly describes the unbeliever's twentieth-century attitude to religion.

Organized humanism did not entirely thrive now that it faced mostly indifferentism rather than hostility. The publications of the RPA had an impact, showing some decline in the 1920s but a revival in the 1930s with the very popular Thinker's Library series. Science was very important to the RPA: J. B. S. Haldane, Karl POPPER, and Albert Einstein were among those thinkers with connections with the RPA. The RPA's publishing program was overtaken by left-wing books in the thirties and the paperback revolution after World War II. The RPA's magazine, the *Literary Guide*, became the *Humanist* in the 1956 and the *New Humanist* in 1972 and continues today as a bimonthly.

The National Secular Society persisted with determination, with Chapman COHEN succeeding G. W. Foote as president, being more of a philosopher with a particular interest in materialism (see MATERIALISM, PHILOSOPHICAL). The NSS journal the *Freethinker* became a monthly in the later part of the century, and survives to this day as a lively polemical paper. Its supporters claim that its "negative" attitude is a positive call for change. It particularly argues for the rights of the nonreligious, for free speech, for separation of church and state, for the removal of state support for religious schools, and for the abolition of blasphemy laws. A blasphemy case created a stir in 1977, when Mary Whitehouse, a Christian morals campaigner, brought a prosecution against the newspaper *Gay News* for publishing a poem in which Jesus was depicted as a homosexual (see GAY HUMANISM). The editor was found guilty, fined, and given a suspended sentence. The blasphemy law remains on the statute books. The Gay and Lesbian Humanist Group began soon after the prosecution, energized with a particular case to argue and a particular constituency to support.

The BRITISH HUMANIST ASSOCIATION (BHA) emerged out of the ethical movement and was launched in 1963 in the House of Commons with the philosopher A. J. Ayer and Sir Julian HUXLEY as speakers. Ayer's "linguistic analysis" analyzed God out of the language (see LOGICAL POSITIVISM); Julian Huxley's *Religion without Revelation* (1927) indicated the softer line some humanists were taking. The BHA developed a network of local groups and offered nonreligious ceremonies (which today provide a major window to humanism for the general public). H. J. Blackham was a leader in founding and developing the BHA. Abortion, homosexuality, censorship, disarmament, race relations—all became matters of great concern to humanists.

The British Broadcasting Corporation (BBC) was first led by John Reith, a religious man with a believing agenda to push. Humanists have argued ever since for a fair place on the airwaves. Meanwhile non-Christian religions have become more important, Islam especially, and unbelievers' critical searchlight no longer focuses entirely on Christianity. In any case, Christianity had become a fuzzier target as Christian liberals abandoned metaphysics, increasingly defining their faith in such terms as "the ground of our being" and "ultimate concerns": Bishop John Robinson brought such theories (from Paul Tillich in particular) to the public.

There has been much discussion about the secularization of society: in two senses there can be no doubt of this—first, churchgoing in Britain has declined considerably; second, people and institutions no longer take religious "truths" as their guides in making decisions or creating their attitude toward life (see LIFE STANCE; MORALITY FROM A HUMANIST POSITION). This may be partly due to intellectual changes, partly to a preference for enjoying life without the hindrance of religion.

The nineteenth-century optimism upon which unbelief floated found itself in the twentieth century, despite its considerable advances, facing the pessimism that world wars and genocide engendered. Whether unbelief can replace religious belief remains an open question.

UNITED SECULARISTS OF AMERICA. This twentieth-century US organization began in March 1947 with the publication of the first issue of the monthly *Progressive World*. *Progressive World* in turn represented the amalgamation of five different publications: the *Orr Publications*, edited by Hugh Robert Orr; the *Humanist World*, edited by Lowell H. Coate; *Action for Human Welfare*, edited by Ray S. Kellogg; the *Comet*, edited by Gus Horack; and the *Hornet*, edited by W. Henry Davis. William McCarthy was also listed as a consulting editor, though he was not affiliated with any of the founding publications. These editors combined to form the American Progressive Association.

The first issue of *Progressive World* described the publication as intended to be governed by its subscribers. The founding editors stated that they wanted to promote freethought without money collected for subscriptions and donations going into private hands. It was their belief that the FREETHOUGHT movement itself had failed for this reason, causing there to be no truly national organization that spoke for freethinkers, rationalists, humanists, and the like, as at that time there was not. The editors wished to unite the many "freethinkers, humanists, progressives and liberals." The premier issue also included a "Purpose and Policy" statement, with strong similarity to the mission statements of many freethought-related groups today. Separation of church and state, elimination of superstition, promoting the taxation of church property, and keeping religion out of the public schools were all mentioned in this policy statement.

Progressive World held its first convention in August 1947 in Los Angeles. There began the project of organizing subscribers into the governing body of the magazine. The "owner-subscribers" named themselves the Progressive World Associates (PWA), and worked out how this publication would be run. Lowell H. Coate was named editor in chief, and the board of trustees was expanded.

The next organizational step occurred in the following year. The second convention was held in August at Chicago. This convention brought various regional freethought-related organizations together to create a national "union," which had not existed since the days of the old NATIONAL LIBERAL LEAGUE. Twelve groups were represented at the convention, including the FREIE GEMEINDEN of Milwaukee, the Friendship Liberal League, several humanist Unitarian churches, and the PWA. Under the union's constitution, each group would retain its individual status, but also be a part of the national organization. It was decided to change the organization's name so that the PWA would not be confused with the new national union of which it was a part. The name chosen for the new union was United Secularists of America, or USA. As for PWA, it became a local group based in Clifton, New Jersey, where *Progressive World* had been founded.

The editorial staff changed at this time as well. Lowell H. Coate being unable to continue as editor, Sherman Wakefield, formerly managing editor, was promoted to executive editor. Wakefield was married to Eva Ingersoll Brown, granddaughter of Robert Green INGERSOLL. Eva Ingersoll Brown Wakefield was a contributing editor, and wrote many times for *Progressive World*.

Progressive World and the USA continued to flourish. McCarthy, generally regarded as the USA's founder, became its business manager in late 1955. *Progressive World* moved its headquarters briefly to Chicago, then back to Clifton. A joint headquarters building for *Progressive World* and USA in Clifton was planned and funds raised toward its construction. Culbert L. Olson, freethought activist and former governor of California, was named chair of the building fund committee.

Scandal broke out in late 1957 when McCarthy was accused of filing false financial reports. A new treasurer and business manager were named and the editorial office was moved from Clifton to Los Angeles. The move occurred because Orr had been renamed as *Progressive World*'s editor and he refused to move to New Jersey. McCarthy lobbied the board to fire Orr, but he was unsuccessful. McCarthy resigned but refused to release the organization's papers to the new managers. A legal battle ensued. McCarthy died in November 1958 without surrendering the papers. The USA was eventually incorporated in California, with an East Coast branch in Clifton.

The USA continued to publish *Progressive World* but gradually declined. By 1981, the all-but-moribund USA suspended publication of *Progressive World*. Shortly afterward, Walter F. Kennon transferred ownership of the USA to the Madalyn Murray O'HAIR's American Atheists (AA). O'Hair listed the USA as an affiliated organization under American Atheists. It began to operate as a depository for AA's trust fund in 1988.

The USA became newsworthy again in 1995 in connection with the disappearance of Madalyn O'Hair, her son Jon Garth Murray, and daughter Robin Murray O'Hair. The three atheist activists were later found to have been kidnapped and murdered. According to reports, between $500,000 and $650,000 from the USA trust also disappeared. As is now known, the kidnappers had extorted the funds prior to killing them.

TIMOTHY BINGA

UNITED STATES, UNBELIEF IN. Contemporary Americans often assume that orthodox Christianity always dominated national life. In fact, surprising numbers of Americans simply ignored or rejected religious belief. No less underestimated may be the number and sophistication of organizations expressing ATHEISM, AGNOSTICISM, HUMANISM, SKEPTICISM, FREETHOUGHT, RATIONALISM, infidelity, or other forms of unbelief. This article will trace the history of unbelief in the United States.

The Revolutionary Era and Deism. On the eve of the American Revolution, a mere 17 percent of Colonials belonged to any Christian congregation. Sociologists Roger Finke and Rodney Stark maintain that this did not reflect external causes such as difficulty in reaching a church under frontier conditions, but rather (by modern standards) a very low level of participation in orthodox congregational life. Many among the more wealthy, educated, and politically active embraced some form of DEISM. Deism holds that a creator god exists, but cares nothing for human welfare and ordains nothing as to how men and women should live. As David Berman and others have noted, until the work of Charles DARWIN and Gregor Mendel furnished an intellectually satisfying model of how living things might have come to exist without miraculous intervention—an innovation of the nineteenth century—deism was about as far in the direction of unbelief as most educated people could stretch their minds. As an index of their boldness of thought, we may think of Revolutionary-era deists as the atheists or agnostics of their day. Surely they disbelieved in conventional Christianity.

Deism was widespread among the new nation's Founding Fathers. Thomas JEFFERSON, George Washington, John Adams, Thomas PAINE, Benjamin FRANKLIN, and James MADISON are positively known as deists. Nor was deism restricted to the highest ranks: Ethan ALLEN, homespun hero of Ticonderoga, made his deism conspicuous only because he published a book about it.

Deist literature was widely distributed, much of it imported from the mother country. In 1787 Ethan Allen released the first openly deistic and anti-Christian book published in North America: his own *Reason, the Only Oracle of Man*, published at Bennington, Vermont. Allen presented a rambling but reasonably sound rationalist critique of Christian doctrine. A fire at the publisher's offices destroyed much of the original edition, making copies extremely rare.

American deism peaked between 1795 and 1810 in the wake of the US appearance of Thomas Paine's *The Age of Reason* (1795). Though critics derided it as atheistic, *The Age of Reason* was in fact steeped in deism; Paine's text made clear that his aim was to protect reasonable and salutary religion (that is, deism) against the danger that conventional Christianity's gross absurdities might induce thinking people to discredit religion altogether. Nonetheless, by providing a powerful and most of all accessible debunking of core Christian beliefs, *The Age of Reason* arguably did more than any other single work to encourage abandonment of Christianity in favor of unbelief. The only book cited by more post-Revolutionary freethinkers as the cause for their renunciation of faith is, ironically enough, the Bible.

The first explicitly unbelieving organizations in the United States were deistic societies founded in New York, Philadelphia, Baltimore, and Newburgh, New York, by Elihu PALMER, a blind lawyer who became the new nation's leading deist preacher. Palmer published two deistic magazines at New York, *Temple of Reason* and *Prospect, or View of the Moral World.* His 1801 book *Principles of Nature* sold out three editions within five years.

Early Freethought. With Palmer's death in 1806 and Paine's in 1809, activity related to unbelief briefly vanished from the record. When it reappeared it would display a different social character, appealing to the working classes as much as to the educated elites who had largely sustained earlier deism. Unbelief reappears with a Thomas Paine birthday celebration organized in New York by Paine admirers on January 29, 1825. Out of this event eventually sprang a group called the Free Press Association, cofounded in 1827 by activist Benjamin OFFEN, apparently the first American to make his living as a freethought lecturer. In addition to his weekly lectures, Offen supported a radical magazine, the *Correspondent* (1827–29), edited by George Houston. Interest in unbelief was again on the upswing; in 1829 Robert Dale OWEN and Frances WRIGHT abandoned their utopian colony at New Harmony, Indiana, to establish their freethought paper the *FREE ENQUIRER* in New York. Aligned with it would be two organizations, the Society of Moral Philanthropists and its successor, the Society of Free Enquirers.

Self-taught Universalist minister (see UNIVERSALISM TO 1961) Abner KNEELAND arrived in Boston in 1830 to lecture to an existing group, the Society of Free Enquirers, not related to the New York group of the same name. Thereafter Kneeland launched a rationalist and atheist newspaper, the *BOSTON INVESTIGATOR*, for some time the nation's dominant freethought paper. Between 1834 and 1836 Kneeland faced multiple prosecutions for BLASPHEMY. Gilbert VALE edited the monthly freethought publication titled the *Beacon* from New York (1836–46).

At a regional freethought convention at Saratoga Springs, New York, in 1836, Kneeland and Offen urged

creation of a national organization. The result was the United Moral and Philosophical Society for the Diffusion of Useful Knowledge. Despite its ungainly name, the group held annual conventions from 1836 to 1841 and enrolled members from several eastern states. In 1845 the Infidel Society for the Promotion of Mental Liberty was founded at New York; it would operate for three years. The proceedings of its inaugural meeting were published by J. P. MENDUM, second publisher of the *Boston Investigator*, under the title *Meteor of Light.* In 1857 another national organization, the Infidel Association of the United States, was founded at Philadelphia; its officers included *Boston Investigator* principals Horace SEAVER and J. P. Mendum, and feminist radical Ernestine ROSE. It met annually until at least 1860.

While unbelievers continued to use labels like "deist" and "infidel," a consensus was emerging as to the dominant term connoting religious skepticism. *Freethought* had emerged as a one-word term of art, suggesting the result of open inquiry and unfettered thought applied to the teachings of religion, particularly Christianity. The subtext was, of course, that the doctrines taught by the churches were obviously false, demonstrably contradictory, ill-defined, or perverse, so that any sincere, extended contemplation upon them must necessarily result in their abandonment.

The "Forty-Eighters." With the failure of the 1848 democratic revolution in Germany, thousands of politically and religiously liberal Germans fled to the United States. They accumulated where settlement was then most vigorous, a broad arc extending from Minnesota and Wisconsin through Kansas and Missouri into the Texas hill country. The "Forty-Eighters" founded numerous freethought papers and fraternal organizations. At Hermann, Missouri, Charles Strehly and Eduard Mühl published the *Licht Freund* (Friend of Light), which advocated abolition and ANTICLERICALISM. Every sizable German American community had a FREIE GEMEINDEN (Free Mind) society; their legacy included substantial halls in cities from Milwaukee to Saint Louis. *Turnvereins* or Turners' Clubs appeared wherever German Americans settled, promoting physical development and mutual defense through gymnastics and military drill, alongside an often strong component of freethought rhetoric (see MONUMENTS TO UNBELIEF). Nor was German American freethought activism limited to the Midwest. The *Blätter für Freies Religiöses Leben* (Paper for Free Religious Life) was edited by F. Schueneman-Pott in San Francisco and later Philadelphia. Nor was German the only language in which such freethought was expressed: the Swedish-language freethought paper *Forskaren* (The Scholar) was published in Minneapolis from 1893 to 1924.

The Golden Age of Freethought. The period between 1860 and 1900 is known as the Golden Age of Freethought. It marked a high point for unbelief in the United States as it did in England. In the United States, the most conspicuous personalities were Benjamin Franklin UNDERWOOD, Robert Green INGERSOLL, DeRobigne Mortimer BENNETT, Samuel Porter PUTNAM, H. L. Green, Charles B. REYNOLDS, John E. REMSBURG, Thaddeus Burr WAKEMAN, and E. M. MACDONALD. This was the great age of American oratory, when public lectures on every subject were a dominant form of entertainment as well as education. Freethought lecturers moved about the country, inveighing against religion and debating clergy. For most it was an economically marginal enterprise of coach-class travel and home hospitality, but not for Ingersoll, the "Great Agnostic."

Ingersoll was not merely the most popular freethought orator, he was the most popular—if controversial—lecturer on the American "chautauqua" circuit. From the late 1860s until just before his death in 1899, he traveled the country lecturing to packed houses and was ubiquitous in newspapers and magazines. He considered God's existence unknowable, Christian doctrines ridiculous, and eternal punishment morally reprehensible. Ahead of his time, he advocated genuine equality for blacks and women, compassionate treatment of prisoners, economic justice for laborers and farmers, and other progressive causes. Despite his outspoken unbelief Ingersoll was the Republican Party's highest-profile political speechmaker; during his public life, no GOP presidential candidate whom he declined to endorse attained the White House.

Ingersoll also served unbelief as an attorney and as an officer of freethought organizations. When D. M. Bennett was arrested in Watkins (now Watkins Glen), New York, in 1878 for selling a birth control pamphlet (see BIRTH CONTROL AND UNBELIEF; MONUMENTS TO UNBELIEF), Ingersoll interceded with President Rutherford B. Hayes in an effort to deflect prosecution under the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF). When Charles Reynolds was tried for BLASPHEMY in New Jersey in 1887, Ingersoll defended him pro bono. When Reynolds was convicted, Ingersoll paid the fines and court costs. Along the way he had heaped such ridicule on the idea of state blasphemy prosecutions that no other such case ever reached trial. Ingersoll was repeatedly an officer of the NATIONAL LIBERAL LEAGUE, the largest freethought organization of the time, though he resigned in 1880 when it pressed for repeal of the Comstock Laws (see WAKEMAN, THADDEUS BURR). Ever the family man, Ingersoll feared creating the impression that freethinkers favored distribution of obscene materials through the mails.

The Golden Age was also distinguished by a cornucopia of freethought publications and organizations. Peter Eckler founded the company that bore his name in the 1840s; it published the semimonthly *Age of Reason* between 1848 and 1851, but published freethought books and pamphlets for almost eighty years. The Eckler Company also did printing for other freethought publishers, notably Clinton P. Farrell, Ingersoll's son-in-law

and official publisher. Another important publisher was the Truth Seeker Company, which produced numerous books and pamphlets as well as the magazine of the same name. Principal freethought publications of the early Golden Age included *The Truth Seeker*; *Freethought*, edited from San Francisco by Samuel Porter Putnam and George Macdonald; *Iron-Clad Age*, a weekly edited from Indianapolis by J. R. Monroe between 1891 and 1898; and the *Boston Investigator*, still active from the preceding period.

The *Truth Seeker* was founded by D. M. Bennett in Paris, Illinois, in 1873, originally because Bennett despaired of inducing other papers to print his letters rebutting local ministers. After a year Bennett moved the paper to New York, expanded its circulation, and made it a weekly. He became a notorious adversary of decency crusader Anthony Comstock, and was repeatedly prosecuted by him, dying in 1882 as a result of an imprisonment Comstock had engineered. Editorship of *The Truth Seeker* passed to Eugene Macdonald, and in 1909 to Eugene's brother George E. Macdonald. By 1937 *The Truth Seeker* was no longer of national significance; in that year the aged Macdonald transferred the editorship to the eccentric Charles Lee SMITH.

Other significant publications included *Freethinker's* magazine (later *Freethought* magazine), published in Buffalo and Chicago by H. L. Green; the *Index*, published in Toledo and later Boston by Francis E. ABBOT and Benjamin F. Underwood; and the *Blue Grass Blade*, published weekly in Kentucky by Charles C. MOORE between 1884 and about 1905.

Some important freethought publishers have already been mentioned. The Truth Seeker Company was probably the most active during the nineteenth century. A close second was the J. P. Mendum Company of Boston, which grew out of the *Boston Investigator* after Mendum succeeded *Investigator* founder Abner Kneeland as the paper's publisher. Mendum was later succeeded by his son Ernest. Horace Seaver, who had succeeded Kneeland as the *Investigator*'s editor, was succeeded in turn by Lemuel K. WASHBURN. Also significant was Freidenker Publishing of Milwaukee, the largest supplier of German-language freethought materials.

The Golden Age also saw the birth of several prominent freethought organizations. Among the most important was the NATIONAL LIBERAL LEAGUE; this became the AMERICAN SECULAR UNION, which merged with the Freethought Federation of America circa 1919. Also noteworthy was the New York Freethinkers' Association (1877–late 1880s) whose annual conventions attracted unbelievers nationwide; D. M. Bennett's 1878 arrest at Watkins occurred at a New York Freethinkers Association convention.

Even in the Golden Age, freethought carried a tang of radicalism and appealed only to minorities. Still, it had sufficient mainstream appeal that some broadly influential progressives were willing to identify themselves as freethinkers, if not to become deeply involved in organized freethought. Among these were Thomas Alva Edison, Andrew Carnegie, Stephen Girard, Luther Burbank, and Charles Steinmetz. Also noteworthy is Mark Twain (see CLEMENS, SAMUEL LANGHORNE), whose posthumously published *Letters from the Earth* excoriated traditional Christianity. An authoritative edition of this long-closeted work did not appear until 1962.

Women in Freethought. The nineteenth-century woman's rights and woman suffrage movement meshed closely with freethought (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). Amy Post was active in the New York Freethinkers Association and a variety of liberal religious causes as well as early feminism. Susan B. Anthony, born to a Quaker family in Adams, Massachusetts, and active in antislavery and temperance before the Civil War, devoted herself almost entirely to suffrage after 1854. In 1872 she was arrested and fined one hundred dollars for contriving to cast a vote at Rochester, New York. Her personal views were agnostic, though on pragmatic grounds she championed alliances between the suffrage movement and Christian temperance groups. In so doing she betrayed two more explicit freethinkers who had been conspicuous comrades in the suffrage movement, Elizabeth Cady STANTON and Matilda Joslyn GAGE. Stanton was a longtime member of the American Secular Union and an occasional contributor to *The Truth Seeker*; among her best-known works, *The Woman's Bible* (1895), an exposé of biblical misogyny, aroused sharp protest. Stanton had built her reputation in the woman's rights movement before revealing the scope of her unbelief, so that her memory was not wholly marginalized; Matilda Joslyn Gage was less fortunate. Coauthor with Stanton and Ida H. Harper of the authoritative four-volume *History of Woman Suffrage* (1881), Gage advocated for freethought throughout her career, and was until recently neglected in women's studies. Her 1893 *Woman, Church and State* unflinchingly attacked religion, particularly Christianity, for legitimating women's oppression through the ages. Gage also influenced the thinking of her son-in-law, L. Frank BAUM, author of the *Oz* children's books. One views the "Pay no attention to the man behind the curtain!" climax of *The Wizard of Oz* (filmed 1939) through fresh eyes after learning how profoundly Baum's thinking had been shaped by Gage's freethinking. Still, Baum himself was a Spiritualist as much as he was a freethinker (see SPIRITUALISM AND UNBELIEF).

Radical Social Reform and Freethought. Organized freethought interpenetrated with several American radical and reform movements, even Spiritualism. This is not so contradictory as it might appear; early on, before Spiritualism's empty paranormalism was well understood, noted scientists and freethinkers seriously imagined that it might offer evidence for an afterlife independent of Christian beliefs. Among freethought leaders who embraced—or defected to—Spiritualism, the best

known is England's Annie BESANT, the close colleague of Charles BRADLAUGH who in the 1890s abandoned freethought for THEOSOPHY. Americans who followed similar trajectories include George Henry Walser, founder of the freethought town LIBERAL, MISSOURI; and freethought lecturer Benjamin Franklin Underwood.

Anarchism was a mostly European movement with an explicit anti-Christian or post-Christian stance. Anarchism attracted American adherents also, though its scope and power were often exaggerated by frightened cultural conservatives. American anarchists and freethinkers include activist-poet Voltairine DE CLEYRE, Emma GOLDMAN, and labor radicals including the Wobbly protest songwriter Joe Hill, whose "The Preacher and the Slave" is the most popular explicitly antireligious song in US history (see LABOR AND UNBELIEF).

Unlike anarchism with its European roots, sex radicalism and the free-love movement were largely American originals. Among the earliest sex radicals were birth control advocates (see BIRTH CONTROL AND UNBELIEF; SEXUAL VALUES, IMPACT OF UNBELIEF ON), many of whom were freethinkers. Charles KNOWLTON of Massachusetts self-published a pioneering birth control booklet, *Fruits of Philosophy*, around 1830. Though his religious views are not clearly known, his book became a staple of freethought publishers; in England, the atheist Bradlaugh and then-freethinker Besant faced an 1877 trial for publishing *Fruits of Philosophy* there. Another American freethinker, Edward Bliss FOOTE, published an 1864 book *Medical Common Sense* containing what may be the first modern description of condoms and diaphragms. Margaret SANGER, a freethinker's daughter, eventually won social acceptance for birth control in the United States and founded Planned Parenthood. Toward the end of her career she cosponsored research that led to the development of the 1960s birth control pill by freethinker Gregory Pincus.

As opponents of conventional structures for ordering the family, marriage, and sexual expression, sex radicals necessarily stood in tension to Christianity. Many were explicit atheists or freethinkers, also active in abolitionism or anarchism. The anarchists de Cleyre and Goldman were sex radicals in their writings and in their personal lives; Goldman promoted birth control. Stephen Pearl Andrews was a freethinker and socialist who cofounded Modern Times, a short-lived utopian free-love community east of New York City. Among the more extreme sex radicals were Ezra HEYWOOD, whose 1876 attack upon marriage and birth control handbook titled *Cupid's Yokes* precipitated D. M. Bennett's 1878 arrest. In Kansas, Moses HARMAN published the free-love paper *Lucifer, The Light Bearer*, which also ran freethought items. While Harman was imprisoned under the Comstock Act, freethinker Lois WAISBROOKER took over *Lucifer*, publishing even more outspoken free-love and birth control articles; her writings often blamed religion for the oppression of women. Ben LINDSEY, a free-thinking twentieth-century reformer, argued for sex education, availability of birth control to unmarried women, and easier divorce. His best-known work was *The Companionate Marriage* (1927), in which he argued that matrimony should endure no longer than the partners' passion for one another.

Science, Religion, and Unbelief. The Golden Age of Freethought drew further momentum from the spread of BIBLICAL CRITICISM, which undercut the perceived authority of Jewish and Christian scripture. A flurry of scientific works challenged traditional Christian views to similar effect. As early as 1830, geologist Charles Lyell refuted Genesis chronology with his *Principles of Geology* (1830–33), marshaling rock-strata evidence for an ancient earth. Lyell's work influenced Charles DARWIN, whose 1859 *On the Origin of Species by Means of Natural Selection* precipitated enormous controversy (see EVOLUTION AND UNBELIEF). In 1863 Darwin's outspoken defender Thomas Henry HUXLEY published *Man's Place in Nature*, arguing that humans had been shaped by evolutionary forces no less than lower animals and anticipating arguments Darwin would offer eight years later in his *Descent of Man*. In 1874 American chemist and historian John William DRAPER published his bombastic *History of the Conflict between Science and Religion*, introducing the "military metaphor" of RELIGION IN CONFLICT WITH SCIENCE. In 1896 Cornell University cofounder Andrew Dickson WHITE (a believing Unitarian) completed the popularization of this metaphor with his *History of the Warfare of Science with Theology in Christendom*. Where Draper had traced Christian hostility toward science largely to Catholicism, White was more ecumenical, demonstrating that Protestant Christianity was no less guilty of hobbling discovery.

The Twentieth Century. Ingersoll died in 1899, never having translated his immense fame into an enduring freethought organization or periodical. (A twelve-volume edition of his collected *Works* remained in print from 1900 to 1929; editions after 1916 contained thirteen volumes, including an adulatory 1911 biography of Ingersoll by Herman Kittredge.) Ingersoll's death heralded the end of the Golden Age. In part, freethought was a casualty of its own success; much of the freethought critique had entered mainstream opinion and was no longer radical. Educated early twentieth-century moderns knew the earth was ancient, living things had evolved, and the Bible had developed over time. Many among them took irreligion for granted.

Still, organized freethought (which began to refer to *itself* as "atheism," rather than having the word hurled at it by enemies) did not want for advocates. Among the leading names in this period were Clarence DARROW, Emanuel HALDEMAN-JULIUS, Joseph MCCABE, Charles Lee Smith, Joseph LEWIS, Marshall Jerome GAUVIN, James Hervey JOHNSON, Madalyn Murray O'HAIR, Gordon STEIN, and Paul Kurtz. Also noteworthy were humanist and religious humanist movements whose

thrust leaned toward unbelief (see HUMANISM; SECULAR HUMANISM; RELIGIOUS HUMANISM; UNITARIAN UNIVERSALISM). Religious humanist groups included ETHICAL CULTURE and the AMERICAN HUMANIST ASSOCIATION.

Darrow is well known for his lawyerly work, especially during the Scopes monkey trial of 1925 (see EVOLUTION AND UNBELIEF). An outspoken atheist, his 1932 autobiography offered an extended disproof of God's existence (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). Emanuel Haldeman-Julius was the most astute businessman and promoter to emerge from the American Socialist movement (see SOCIALISM AND UNBELIEF). He turned a marginal Girard, Kansas, socialist tabloid into a publishing empire, along the way substantially inventing direct-mail marketing and the paperback book. He sold more than three hundred million of his Little Blue Books and Big Blue Books: compact, low-priced booklets, often on radical topics, that working people could afford and understand. Through the UNITED SECULARISTS OF AMERICA he published the periodical *American Freeman* (launched 1941), which continued until 1982 as *Progressive World*. The ex-priest Joseph McCabe supported himself by his pen for half a century, prolifically producing historical, philosophical, and freethought works, many of them published by Haldeman-Julius.

Charles Lee Smith was an Arkansas-born lawyer who moved to New York and in 1925 founded the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM ("the 4As"). Perpetually undercapitalized, the 4As achieved some impact through skillful media manipulation, especially with regard to the organization's largely vaporous plan to found atheist groups at vast numbers of American high schools. The 4As influenced legendary filmmaker Cecil B. DeMille, who based his last silent picture, *The Godless Girl* (1929), on one of the most charismatic 4As promoters, the Los Angeles–based child "atheist evangelist" Queen SILVER. Smith also debated and conducted bombastic campaigns against creationism. In 1937 he acquired the faded *Truth Seeker* from its aged second editor, George Macdonald. Influenced by associate editor Woolsey TELLER, Smith elbowed the paper toward social conservatism, anti-Semitism, racism, advocacy of EUGENICS, and ultimately obscurity. Smith died in 1964, passing the failing paper's editorship to James Hervey Johnson.

Joseph Lewis was the most prominent exponent of American atheism prior to Madalyn Murray O'Hair. He led the Freethinkers of America from 1925 until his death in 1968. Lewis instituted numerous church-state lawsuits and made many media appearances on behalf of atheism. He authored several books and edited a newsletter that ran under various titles for more than thirty years. He donated several statues of Thomas Paine still on view in the United States, England, and France, and engineered a successful drive for a US postage stamp memorializing Paine. He masterminded the second restoration (1954) of the Robert Green Ingersoll birthplace in Dresden, New York (see MONUMENTS TO UNBELIEF). Marshall Gauvin was a Canadian who gave hundreds of rationalist lectures in the United States and Canada, wrote for *The Truth Seeker*, and in 1926 moved to Winnipeg, Mantioba, where he led a rationalist group. Between 1946 and 1954 he returned to New York to serve as president of a new and ultimately unsuccessful National Liberal League, named for the illustrious nineteenth-century freethought organization. In 1954 he returned to Winnipeg, remaining active in freethought until his death at age ninety-seven in 1978.

James Hervey Johnson succeeded Charles Lee Smith as editor of *The Truth Seeker* in 1964. He continued Smith's racism, anti-Semitism, and enthusiasm for eugenics, adding fringe medicine and arcane financial theories to the mix. Under his editorship *The Truth Seeker* became a crudely printed, typewritten hate sheet whose circulation descended to merely hundreds. Yet his investment principles had proven effective, abetted by his miserly lifestyle; at his death in 1988 Johnson left an estate of more than $16 million, part of which funded a charitable trust which has since the early 1990s functioned as the largest single source of charitable support for American unbelief. An ill-advised attempt by Madalyn Murray O'Hair to seize control of Johnson's estate shortly before his death led indirectly to the kidnapping of O'Hair and her children and their 1995 murder.

Madalyn Murray O'Hair. Madalyn Murray O'Hair was the most conspicuous US atheist in the second half of the twentieth century. Whether atheism benefited is subject to debate. A free-floating radical with casual communist ties, Madalyn Murray brought a lawsuit (*Murray v. Curlett*) against the Baltimore, Maryland, public schools over compulsory school prayer on behalf of her son William. Combined by the US Supreme Court with a similar case (*Abington School District v. Schempp*, brought by a Unitarian), it yielded the historic June 17, 1963, high court ruling ending teacher-led school prayer. On the plus side, this victory put atheism back on the cultural map after its near-suppression during the Cold War and created a momentum toward increasing secularization in American life that persisted for more than thirty years. On the minus side, it inspired decades of retrenchment and reorganization by US religious conservatives, paving the way for a fundamentalist resurgence that began in the late 1970s. Claiming more than her share of credit for the 1963 Supreme Court decision, the abrasive O'Hair (as she was known after marriage to Richard O'Hair) built American Atheists, until her death the country's largest atheist organization. Her tirade against a Bible reading by *Apollo* 8 astronauts circling the moon further swelled the roster of her enemies—but also ensured that when *Apollo* 11 landed on the moon in 1969, humanity's greatest technological achievement was wholly secular in character. O'Hair's numerous lawsuits

ranged from quixotic efforts to remove "In God We Trust" from US currency and coins to the more significant *O'Hair v. Hill* (1984), which invalidated state laws barring atheists from public office, state employment, and jury service. Her son William, the former Supreme Court plaintiff, led a difficult life; Madalyn adopted William's illegitimate daughter, Robin, whom she raised thereafter as her own daughter. William later embraced fundamentalist Christianity and became a fixture on the evangelical lecture circuit. O'Hair ran American Atheists in mercurial fashion, purging members at whim. She also attracted millions of dollars in donations, which she sometimes treated as personal funds. In 1987 she launched a groundless effort to seize control of the Truth Seeker Company, key to the estate of the then terminally ill James Hervey Johnson. The effort quickly collapsed, sparking countersuits by Johnson estate trustees, Johnson himself having died in the interim. Most observers expected O'Hair to lose those suits to devastating effect; O'Hair apparently agreed. Evidence suggests that O'Hair, her son John Garth Murray, and now-daughter Robin Murray O'Hair arranged to transfer hundreds of thousands of dollars in American Atheist funds to New Zealand with plans to abscond there. Instead David Waters, a felon caught stealing while employed by American Atheists whom O'Hair had excoriated in the organization's newsletter, led a conspiracy that kidnapped the trio, extorted most of their liquid funds, and murdered Madalyn, Jon, and Robin in 1995. In a bizarre twist, police made little effort to track these high-profile missing persons until estranged evangelist son William Murray exerted political pressure. Not until 2000 was a conspirator, Gary Karr, convicted—not of murder, but merely of conspiracy.

Gordon Stein was the foremost collector and bibliographer of freethought materials in the second half of the twentieth century. He was longtime editor of the *American Rationalist*, a bimonthly founded in 1956 by the American Rationalist Federation. Stein also compiled numerous bibliographies and encyclopedias, including the original *Encyclopedia of Unbelief* (1985). He was founding director of the Center for Inquiry Libraries, now the world's largest repository of English-language atheist, humanist, freethought, and skeptical materials. He died in 1996.

Several atheist organizations formed during the second half of the twentieth century, most remaining active today. American Atheists still operates, though on a smaller scale than in O'Hair's heyday. Based in New Jersey, it is led by Ellen Johnson, who attained control during the confusion following the O'Hair kidnappings. Perhaps the most active organization is the Freedom From Religion Foundation (FFRF), founded in Madison, Wisconsin, in 1976 by former O'Hair colleague Anne Nicol Gaylor. Aided by her daughter Annie Laurie Gaylor (a prolific contributor to this encyclopedia) and Annie's husband, evangelist-turned-atheist Dan Barker, FFRF publishes the monthly newspaper *Freethought Today* and varied freethought books and tracts. It has won significant church-state legal victories, especially in the Midwest. Atheists United, based in Los Angeles, was formed in 1982 from a group of American Atheists chapters cut adrift after Madalyn O'Hair ended the American Atheists chapter network. The group is active in various metropolitan areas and conducts an annual convention.

The Rise of Humanism. During the second and third quarters of the twentieth century, there occurred a "passing of the torch" as intellectual prestige and organizational energy passed from traditional atheism and freethought to the movement known as humanism. Where atheism and freethought traced their roots to the Enlightenment, the French Revolution, anticlericalism, and radical social reform movements, humanism sprang from Jewish and Christian liberalism. As early as 1876 Felix Adler had founded Ethical Culture as a naturalistic, secularizing offshoot of Judaism. Liberal Christianity gave rise to varied movements that responded to such causes as Darwinism and biblical criticism by reinterpreting Christianity in more secular terms. This trend was especially influential in the Unitarian Church (see Unitarianism to 1961; Unitarian Universalism). In 1933 the *Humanist Manifesto* presented a ringing statement of naturalistic moral ideals. It was drafted by one philosopher, Roy Wood Sellars, and signed by another, the influential John Dewey, as well as several liberal Unitarian ministers. The *Manifesto* became a gathering point for a broad-based movement known as religious humanism. Some religious humanists were supernaturalists who had chosen to attach primary value to this life rather than the next; others were naturalists who rejected beliefs in eternity or any spirit realm but adapted the vocabulary of religion to express the emotional and aesthetic aspects of their life stance. In 1941 Unitarian minister Ed Wilson founded the American Humanist Association (AHA). Recognized by the US Internal Revenue Service (IRS) as an educational nonprofit organization in 1946, AHA enjoyed early vigor, winning the allegiance of international leaders of thought. In the 1960s and early 1970s AHA's magazine, the *Humanist*, achieved relatively large circulation and cultural influence under the editorship of Paul Kurtz. Kurtz drafted a successor to *Humanist Manifesto*, the 1976 *Humanist Manifesto II*, which attracted substantial attention.

One of the AHA's initiatives during the 1960s was a Division of Humanist Counseling, whose members sought privileges of clergy including the power to perform legally binding marriages. In 1968 the AHA applied to the IRS for recognition as a religious organization, which would buttress the Humanist Counselors' clerical standing. This had the effect, apparently unforeseen, of replacing the AHA's educational exemption with a religious one, making the AHA legally equivalent to a church. This made the group—and by extension, humanism itself—easy prey for Christian Right activists eager to portray humanism as a religion. In 1989 the

AHA undertook a reorganization, absorbing a liberal Quaker organization with a plan that this entity would maintain the clergy status of Humanist Counselors while the AHA reassumed an educational exemption. The effort was abandoned with little fanfare, perhaps upon discovery that the 1948 educational exemption no longer existed. A 2002 effort to redefine itself as an educational organization belatedly succeeded in 2007. The AHA still remains the most prominent organizational home for US religious humanists.

The Rise of Secular Humanism. Today the principal vehicle for activist unbelief is the secular humanist movement founded by Paul Kurtz and others. Secular humanism is a comprehensive nonreligious life stance that incorporates a naturalistic philosophy, a cosmic outlook rooted in science, and a consequentialist ethical system (see ETHICS AND UNBELIEF). Secular humanism hybridizes elements from religious humanism with elements from atheism, freethought, and SECULARISM. In sharp contrast to religious humanism, secular humanism is explicitly nonreligious. Yet the label has an ironic history, having achieved currency among religious believers decades before unbelievers took it up. Secular humanism was apparently spoken of as early as the late 1950s as a fuzzy label for a range of modernist initiatives that religious conservatives deplored: everything from EXISTENTIALISM, Freudian psychology (see FREUD, SIGMUND), and humanistic psychology to traditional freethought. In the US Supreme Court decision *Torcaso v. Watkins* (1961), which ended some states' practices of barring atheists from serving as notaries, Justice Hugo L. Black added an ill-informed footnote that listed "secular humanism" among nontraditional religions deserving legal recognition. Though Christian activists have made much of this, such dicta by individual justices carry no legal weight.

By the late 1970s secular humanism had become a favorite target of Religious Right activists. Only in 1980 was the first explicitly secular humanist organization formed: the Council for Democratic and Secular Humanism (CODESH), founded by a group including Gordon Stein and led by philosopher Paul Kurtz. With this event, secular humanism broke away from both religious humanism and socialist intellectualism and set out upon its own ideological path. Kurtz, a professor of philosophy at the State University of New York at Buffalo and former editor of the *Humanist*, drafted a follow-up to his *Humanist Manifesto II* titled "A Secular Humanist Declaration." Signed by scores of prominent intellectuals and activists, it drew wide attention. Also founded in 1980 was the council's journal, *Free Inquiry*. In short order the council established itself as the largest and most vigorous organization of unbelief in the United States. *Free Inquiry*'s circulation regularly exceeded the combined circulations of all other US humanist, atheist, and freethought publications. The council and its sister organization, the Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP), jointly founded the Center for Inquiry in 1995. With its declared mission to promote and defend reason, science, freedom of inquiry, and ethical alternatives in every area of human endeavor, the Center for Inquiry emerged as a principal exponent of naturalism and humanistic ideals and created a network of national and worldwide branches. By 1996 the need to distinguish humanism from communist totalitarianism had passed, and so CODESH renamed itself the Council for Secular Humanism. In 1999 Kurtz drafted a new successor to the *Humanist Manifestos*; *Humanist Manifesto 2000* was signed by more than a hundred leaders of thought and attracted attention worldwide. In 2000 the *American Rationalist* passed from its original Saint Louis–based publishers to the Center for Inquiry.

The Prospects for Unbelief. Unbelief in the United States faces an uncertain future. The nation's idiosyncratic embrace of popular piety remains without precedent: the US since about 1980 is the only first world country in which rates of church membership, belief in religious doctrines, and the like remain at third world levels. Yet even while this trend continues, other indicators suggest new strength for unbelief. Between 1990 and 2000 the fraction of Americans who tell pollsters they have "no religious preference" doubled; so-called nones now constitute 16 percent of the population, more than forty-seven million adults and children (see DEMOGRAPHY OF UNBELIEF). Some late twentieth- and early twenty-firstcentury figures have succeeded in combining outspoken atheism with mainstream prestige, including the scientist-authors E. O. Wilson, Daniel C. Dennett, and Richard Dawkins (a British scientist with a strong independent American following), and social critic Wendy Kaminer. Certain initiatives of the Council for Secular Humanism, notably the International Academy of Humanism and the Committee for the Scientific Examination of Religion, have achieved significant stature in their fields. And new voices have continued to arise in defense of unbelief, among them *New York Times* science reporter Natalie Angier, historian Susan Jacoby, and perhaps most conspicuously Sam Harris, a graduate student whose 2004 antireligious polemic *The End of Faith: Religion, Terror, and the Future of Reason* became a surprise best seller for mainstream publisher W. W. Norton. The chronicle of unbelief in the United States continues to unfold.

UNIVERSALISM TO 1961. Universalism is a religious position that affirms a common ultimate destiny for all humanity, and thus denies the existence of eternal punishment as part of the divine plan.

Universalism in the North America has two distinct roots. One is found in post-Reformation pietism, which held that God's basic attribute was love and that this love could not be thwarted; therefore, in the end, all of creation would be restored to harmony with the divine. The other root is in the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), which applied REASON and logic to religious claims and found the doctrine of endless punishment to be unreasonable and illogical.

At the outset, Universalism offered a Bible-centered corrective to the hellfire teachings of mainstream Christianity. But early on, Universalists insisted that reason is the tool to be used in understanding the Bible, and that where biblical teachings contradicted reason, there was probably some fault in the transmission of the biblical tradition.

Organized as a movement in New England in the late eighteenth century, Universalism expanded into neighboring states and moved west with the frontier. In 1832 the *American Almanac* listed Universalism as the sixth-largest denomination in the country, and the following year the *Boston Recorder* proclaimed Universalism "the reigning heresy of the day."

By 1850 Universalism had stopped growing faster than the population, and by 1900 had begun a serious and steep decline. Some attributed the decline to the diversion of the movement's energies into social concerns. Universalists were champions of separation of church and state; struggled for decades for prison reform and the end of capital punishment; were the first to ordain women with full denominational authority; and spoke out early against slavery and for peace. Others believed that having won the struggle with the orthodox on the question of eternal hell, the movement had lost its central focus and had begun to drift toward formlessness.

As a creedless movement, Universalism attracted a broad spectrum of people—from those who reaffirmed the Christian core of the movement, to those who embraced Charles DARWIN's theory of evolution (see EVOLUTION AND UNBELIEF) and BIBLICAL CRITICISM, to those who, in the years after the Civil War, were entranced with the prospects of Mesmerism, phrenology, and Spiritualism. This provided a rich and heady mix of opinion, but little focus in the effort to halt denominational decline. The demographic shift that occurred in the years after World War I deepened the decline of Universalism, which had been centered in small towns.

Responding to this decline, leaders of the movement began to talk about a "new Universalism"—one larger in focus than Christianity. While only three signers of the *Humanist Manifesto* (see HUMANISM) were affiliated with Universalism, Universalists, with roots in the enlightenment and a historic commitment to the role of reason in religion, could not escape the influence of the emerging humanist movement.

In 1943, addressing the Universalist General Assembly, General Superintendent Robert Cummins said: "Universalism cannot be limited to Protestantism or to Christianity, not without denying its very name. Ours is a world fellowship, not just a Christian sect." Brainerd Gibbons, who would serve as president and general superintendent of the Universalist Church of America, insisted that Universalism and Christianity were simply irreconcilable.

In 1949 the Massachusetts Universalist Convention established the Charles Street Meeting House in Boston and hired Kenneth Patton as its minister. His charge was to create worship forms appropriate to a naturalistic, humanistic religion that had emerged from Christianity

but was no longer defined by it. Patton's output was remarkable in quality and quantity. In a few years, he transformed the Universalist and also the Unitarian movements by providing them with a richly poetic, deeply spiritual language that reverenced the natural world and honored reason and moral compassion.

Unitarians (see UNITARIANISM TO 1961) and Universalists had already toyed with the idea of a merger for nearly a century when a commission on merger was appointed in 1955. The result was the consolidation of the Universalist Church of America and the American Unitarian Association into the Unitarian Universalist Association in 1961 (see UNITARIAN UNIVERSALISM). Universalism, which had begun with a concern for the afterlife, came to the merger focused on the world of here and now. The historic concern for a heavenly reconciliation of all people with God had been transformed into a concern for earthly reconciliation of human beings with each other.

UNIVERSE, ORIGIN OF THE, AND UNBELIEF. Since religions usually claim that our universe was supernaturally created, denying that the universe has divine origins has been an important part of unbelief. The universe, unbelievers think, does not depend on any personal being outside of the natural order.

Philosophical discussions about the origin of the universe center on the classical cosmological argument for the existence of a God, expressing the intuition that everything contingent requires a cause, and that therefore the universe as a whole must be caused by something beyond the natural causes operating within the universe (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). As with most philosophical arguments, varieties of the cosmological argument are never absolutely conclusive. It is not strictly necessary that the universe have any cause, divine or otherwise. Nevertheless, to many philosophers a divine cause for the natural universe has seemed more plausible than the option left to unbelievers, which is to provide no explanation at all.

Recently, however, the debate over the origins of the universe has shifted away from traditional philosophical territory. With the maturing of physical science, the universe as a whole has become subject to investigation within physics. Indeed, modern physics has changed the very concepts involved in discussing origins, such as causality, or a universe. So currently, though the philosophical tradition continues to influence the debate, the question of how the universe came about is primarily addressed by physical cosmology.

Early Ideas. Ideas about the origins of the universe took shape long before modern science. In antiquity, the alternative to stories of divine creation was to present the world as eternal, perhaps self-existing. The Greek philosophical tradition particularly encouraged belief in an eternal universe. Aristotle, for example, argued that some sort of God was necessary as a First Cause, but he also presented arguments that the world was eternal.

As Greek philosophy developed further, the notion of an eternal universe became more closely tied to philosophical ideas about divinity. The God of the philosophers had to be perfect: beyond time, beyond human passions, beyond anything subject to change. This meant that any direct involvement with the changeable realm of material objects would be an imperfection. Especially within Platonic philosophy, the highest divinity did not get its hands dirty with acts of creation. Instead, God "emanated," out of necessity, slightly less perfect intermediate beings such as Reason or Wisdom. These intermediates then did the actual work of shaping the material world. The universe depended on God—it derived its very reality from the God which was ultimately the only truly real being—but it was also eternal. And with a universe eternally emanating from the divine layers of reality, there was less change that even intermediaries had to be responsible for.

The Hellenistic period following Alexander's conquests, and the Roman Empire that followed, brought Greek speculative philosophy together with Near Eastern religious beliefs about creation. The version of Christianity that became the state religion of the Roman Empire tried to integrate philosophy and revealed beliefs in its theology; later, medieval Islam faced a similar challenge. Reason and revelation agreed on many things such as the existence of a supreme being, but there were also points of friction. Pagan philosophy favored an eternal universe, but the guardians of revelation were reluctant to allow other eternal entities alongside their creator God. The God of monotheism was much more personal, much more free to act, compared to the God of the philosophers who could seem too much in the grip of impersonal necessities. So monotheists developed a doctrine of creation ex nihilo. Creation from nothing went further than Near Eastern myths about divine forces shaping primeval chaos; not even raw material could be eternal like God.

Well into the Middle Ages, discussions of origins were framed by the contrast between the pagan option of a universe that was eternal, though dependent on God, and the monotheistic doctrine of creation out of nothing. Conceptually, the notion of creation from nothing was a potent source of headaches, but on the other hand, pagan concepts of eternity could also seem to harbor contradic-

tions. Without the modern apparatus of transfinite mathematics to keep them straight, philosophers had plenty of opportunity to tie themselves into knots when thinking about infinities. Still, since an eternal universe was a pagan idea, it was attractive to the heterodox. Educated dissenters from officially sanctioned religion could embrace an eternal universe as an intellectually respectable alternative. Both in Christendom and the lands of Islam, belief in the eternity of the universe became a marker of infidelity.

The scientific revolution radically changed the accepted picture of the universe. The heavens no longer revolved around the earth; in fact, the heavens no longer embodied divine perfection in contrast with the sublunar realms of change and decay. Copernican astronomy and Newtonian physics presented a world where the same laws of physics applied everywhere, all the time. They joined the heavens and the earth, and removed some of the old philosophical motivations to think that the universe might be eternal. However, in the Newtonian clockwork universe, it was also hard to see how there could be a beginning in time. To reveal the presence of God, early modern science emphasized the classical design argument. Newtonian physics could not, it seemed, explain functional complexity. If the planets had stable orbits rather than undergoing haphazard motion, this must have been because a divine hand adjusted their orbits just so. Moreover, the complex structures of living things were clearly designed by an awesome intelligence. At the start of modern science, it remained easy to think that the history of the universe was as told in Genesis.

Eventually, however, Newtonian physics made it easier to conceive of a universe infinite in space and time. Problems such as the stability of orbits were solved within physics. Geologists found that our planet was much older than a few thousands of years. And finally, biological evolution showed that that complexity did not have to be due to intelligent design. At the end of the nineteenth century, it had become clear that the literal Genesis story was wrong.

Still, there remained one prominent physical argument that the universe was a divine creation in the distant past. This came from the second law of thermodynamics, which suggested that the universe would always change to become more disordered over time. The fate of the universe was regarded to be a "heat death" in which everything became a featureless soup in a state of maximum entropy, able to sustain no life nor any order of any interest. The religious implications of such a view were ambiguous; the notion of a heat death could just as easily feed into an ATHEISM of a cosmic-pessimist style. But believers looked toward the origins of the universe. If the clockwork universe was winding down, there had to be a beginning where an outside force wound everything up. The initial order could not be provided by physics, and there had to be a beginning in time. Once again, the design and cosmological arguments reinforced one another.

Modern Physical Cosmology. In the first half of the twentieth century, modern physical cosmology once again changed the debate over the origin of the universe. The most important theoretical development for cosmology was Albert Einstein's general theory of relativity. Now physicists could treat space and time as a single geometric entity shaped by the distribution of matter/energy throughout the universe. Gravity was due to energy bending space-time.

As it turned out, general relativity made it hard to construct static models of the universe, where the largest-scale structure of the universe looked more or less the same all the time. Einstein realized that his equations could include a "cosmological constant" term which led to a peculiar long-range repulsive force alongside ordinary gravity. A stable universe required a nonzero cosmological constant. Soon, however, the issue was settled by observational evidence: astronomers discovered that our universe was expanding and an expanding universe could be described without a cosmological constant.

Other new observations would also advance cosmology. Indeed, in the twentieth century, cosmology began to enjoy the mutual interaction between theory and observation that characterizes any successful science. Ideas about the origins of the universe could now be subjected to reality tests, becoming more than philosophical speculation. Aside from the expansion of the universe, other observations such as the cosmic microwave background radiation also supported the claim that our universe had started out, billions of years ago, from a much hotter and denser initial state. The Big Bang theory came to dominate cosmology in the second half of the twentieth century. In an expanding universe like ours, general relativity demanded that a singularity should exist back in time—not only was the universe once extremely hot and dense, it was infinitely so at the Big Bang. The Big Bang was, in fact, when the universe began.

It took no great leap of the religious imagination to equate the Big Bang, as the beginning of time, with a moment of creation. And so unbelievers, who have typically identified with the philosophical tradition of an eternal universe, have often been drawn to alternatives to Big Bang cosmology. The problem was that the alternatives were full of arbitrary assumptions, they failed to match the predictive success of the Big Bang, and they did not make sense of multiple independent lines of evidence as did the Big Bang.

One early rival to the Big Bang was the steady-state universe, in which the universe was eternal and looked the same at all times. This required the continual creation of new matter as the universe expanded. Fred Hoyle and collaborators continue working on a "quasi-steady-state cosmology" even today, but this has become a marginal effort, considered a failure by the vast majority of cosmologists. Another alternative that preserved an eternal universe was the notion that the universe oscillated. The expansion of each phase of the universe would be fol-

lowed by a contraction to a "big crunch," followed by a new big bang and another cycle of the universe. This too has numerous difficulties, from failure to fit observations to arbitrary theoretical assumptions needed to make the universe rebound after the big crunch and to overcome the problems due to increasing entropy throughout the cycles. "Plasma cosmology" is the most recent attempt to construct a serious physical alternative to the Big Bang, though it also suffers from numerous defects and thus has not found acceptance in mainstream cosmology.

The standard model of the Big Bang had, besides the beginning, another feature attractive to religious thinkers who were willing to let go of a literally interpreted Genesis. The natural outcome of the Big Bang was a universe that almost immediately collapsed on itself. Our universe has been around for about fourteen billion years. It also looks very similar in all directions, even when areas of the universe farther than fourteen billion light-years apart are observed. But since no physical signal can travel faster than light, such areas could not have interacted with each other to become so similar. Our universe fit the standard Big Bang model, but nothing like our universe could come about unless the parameters that went into the model were adjusted with uncanny precision. This suggested that not only was the Big Bang a moment of creation, but that the creator was a designer who fine-tuned the physics just so the universe could support intelligent life (see ANTHROPIC PRINCIPLE; INTELLIGENT DESIGN THEORY).

So early physical cosmology had ambiguous consequences for unbelief. On one hand, cosmology became an ordinary branch of physics, addressed in the typically naturalistic fashion that dominates modern physics. This development could only demystify the origins of the universe, supporting the view that we live in a natural world that can be understood without gods and demons. On the other hand, in the context of the long-standing philosophical dispute about the eternity of the universe, physical cosmology came down on the side of a universe with a beginning.

Even now, thinkers who argue that science supports theism typically make cosmology a centerpiece of their case. The "kalam cosmological argument" has become popular; it asserts that the universe has a beginning, that everything that begins has a cause, and that the only cause that can act to create a universe is outside of nature—the free choice of a personal agent. Proponents of such updated cosmological arguments usually also bring up cosmic fine-tuning, saying it proves the universe is a result of intelligent design.

Quantum Cosmology. Cosmology today, however, is not so full of signs of God. Much of the current debate over cosmic origins and divine creation barely updates the traditional philosophical dispute; it continues to rely on commonsense understandings of time and causality which have been superseded by modern physics.

In relativity, time is tied to physical events such as the periodic ticking of a clock; time is not external to the physical universe. In general relativity, space-time as a whole is curved by matter/energy; there is nothing especially odd if the geometry of space-time turns out to be curved and finite rather than extending to infinity. It becomes easy to think of space-time as self-contained, regardless of its overall shape. The standard Big Bang is not the beginning of the universe *in* some point of time external to the universe. Physically, time cannot be extended back before the Big Bang. In fact, in the standard picture, time before the Big Bang is a meaningless concept, just like it makes no sense to talk about a location north of the North Pole. A year before the Big Bang is like a place with a latitude of 500°. So thinking of a cause preceding the Big Bang becomes difficult.

The standard Big Bang could still allow an echo of a conventionally conceived cause of the universe, however. This is because the Big Bang is a singularity—a boundary of space-time and hence a very special point. Attaching a God to the singularity can therefore seem attractive. Nevertheless, this is an arbitrary metaphysical exercise unless divine creation also succeeds in explaining some nontrivial features of the resulting universe. Hence a design argument, such as that for cosmic fine-tuning, has to do all the real work.

Even then, there is a fundamental problem. General relativity, and hence the standard Big Bang, is not a quantum theory. Therefore it cannot be entirely correct. It should break down particularly where very high energies and very small distances are concerned—precisely the conditions immediately after the Big Bang. No adequate account of the origins of the universe will be possible without a quantum theory of gravity.

If general relativity warps commonsensical notions of time and causality, quantum mechanics forces an even more radical rethinking. Even in Newtonian mechanics, the laws of physics do not distinguish between forward and backward directions of time; the "arrow of time," or the direction in which entropy increases, emerges only in many-particle systems. Quantum mechanics retains this time reversibility and introduces true randomness in the behavior of particles. The quantum universe is not a place of definite causes and effects, with clockwork motion proceeding in deterministic fashion. Instead, it is a sea of random, uncaused events, where even a "virtual" particle popping into being or vanishing in a vacuum is not a miracle but just the routine way of things. Everyday causes and effects emerge in the macroscopic world, from a substrate of random interactions. In other words, the intuitions about causality and time that go into the classical cosmological argument and the traditional debate about the origins of the universe are not applicable to a quantum universe.

Unfortunately, physicists have not yet been able to combine gravity and quantum mechanics to obtain a full-blown theory of quantum gravity. Still, physicists have *some* idea about what an eventual theory of quantum

gravity should imply, and have been applying approximate quantum approaches to cosmology for some time. A common feature of quantum cosmologies is that they get rid of the singularity as it stands in the standard Big Bang. This removes the last hint, weak though that was, that the physical universe might depend on something external to itself.

For example, the boundary-free cosmology of Hartle and Hawking, though somewhat outdated now, illustrates how the universe can be finite in time and yet entirely self-contained. Their model smears out the singularity, removing the boundary of space-time that existed in the standard Big Bang. No point in the universe can be identified to which to attach a nonphysical cause.

Another approach is inflationary cosmology. Originally, inflation was developed to account for some of the puzzles raised by the standard Big Bang, such as certain kinds of apparent fine-tuning and the fact that the universe looked the same even for areas separated by more than fourteen billion light-years. Cosmology that includes quantum theories of elementary particles allows for a brief episode of "inflation" after the Big Bang, where a small bubble of space-time expanded much faster than the speed of light. Inflation solved the problems it was supposed to address, and was also developed further. Notably, the notion of inflating universes into being naturally brings up the notion of multiple universe-bubbles, perhaps inflating into existence randomly, somewhat like virtual particles in a quantum vacuum. Naturally, without a full theory of quantum gravity, none of these ideas can be worked out in a completely consistent fashion. Still, today, scenarios like chaotic eternal inflation, or infinite sets of universes linked together by what appear as singularities in general relativity (such as black holes), are commonly discussed in physical cosmology. Multiple universes have even been an impetus to think of populations of reproducing universes, and to speculate on whether a Darwinian-style mechanism ensures that large universes that create lots of black of holes, like ours, might be the most common variety.

A leading current approach to quantum gravity centers on the idea that the fundamental particles of physics are not extensionless points but strings or "m-branes." An immediate consequence of such theories is that there is a length scale beyond which objects cannot be compressed—the singularity disappears. String theory–inspired cosmological scenarios typically have an eternal universe, in that time can be extended back before the Big Bang. Still, the physics involved is alien to commonsense conceptions of time, so that thinking of such cosmological scenarios in terms of an eternal universe versus a universe with a beginning is misleading. Neither of the traditional options is really in play anymore.

Physical cosmology today is a rapidly changing field, with few settled conclusions. Large theoretical questions remain, from uniting gravity with quantum mechanics to figuring out problems with the cosmological constant. And improving observations continually produce surprises, such as the recent discovery that the expansion of the universe is accelerating. With better space-based telescopes to come, and further refinements to physical theories, cosmology will continue to change. So today's models of the origin of the universe are all highly uncertain. Nevertheless, some conclusions can be drawn.

Most important, physical cosmology has no need for the supernatural. The universe seems self-contained regardless of whether time can be extended back indefinitely. Any intervention by a supernatural creator would be a strange imposition on the structure of physics. The universe need not be eternal to be uncreated; the traditional debate is simply not relevant anymore. It is not a problem if there is no ultimate explanation for the universe, so that the universe appears uncaused. Modern physics heavily relies on randomness, finding that much in the universe appears to be fundamentally without cause, and that there is no good prospect to find a cause for such events. Physical science has been enormously successful in explaining the world in terms of combinations of chance and necessity—in terms of blind, purposeless, starkly physical processes. Cosmology has progressed in the same direction.

Attempts to provide a theistic explanation for the universe continue. At present, however, it is notable how bringing in God as an ultimate cause does not actually explain anything. Cosmology does not lack for unknowns and surprising discoveries, so any genuine explanation for the universe should be able to predict some new things. But current theistic ideas, including fine-tuning arguments, do not lead physicists to expect anything new; they produce only the dead silence of divine inscrutability. The classical cosmological argument has become irrelevant, and the design argument has become relegated to such fringes of science as the "intelligent design" movement.

TANER EDIS

VALE, GILBERT (1788–1866), Anglo-American freethinker and activist. Gilbert Vale was born in England and in the late 1820s moved to New York, where he taught navigation and higher mathematics. Vale used his income from teaching to finance his passion for FREETHOUGHT.

Vale was a DEIST and an academic in the physical sciences. He published works on astronomy and geology, and this worldview readily explains his devotion to Thomas PAINE. Vale originally wrote his *Compendium of the Life of Thomas Paine* in 1837, and later expanded it to his *Life of Thomas Paine* in 1841. *Life of Thomas Paine* was the first work to publish the correspondences between Paine and George Washington that had been purposefully excluded from earlier biographies of Paine. Vale's work was also the first to embrace Paine as a hero rather than assassinate his character, as the earlier major biographies had done. Vale's devotion to Paine extended to raising the money for a down payment to purchase sixty acres of Paine's original farm in New Rochelle, New York, and he helped to raise the funds necessary to place a memorial on Paine's farm as well (see MONUMENTS TO UNBELIEF).

Vale's other notable work was freethought publishing. He was an editor of several newspapers, including *Citizen of the World* (thought to be the first Sunday paper) and the *Sunday Reporter*. In 1836 he was asked to take possession of the *Beacon* from the United States Moral and Philosophical Society and became its publisher. Vale continued the *Beacon* until 1846, when it changed titles as the frequency of publication changed, and it eventually became the *Independent Beacon* in 1849, and subsequently disappeared. During this time, Vale also published a number of liberal tracts and pamphlets, including Mary WOLLSTONECRAFT's *A Vindication of the Rights of Women.*

Vale was a contemporary of Benjamin OFFEN, Abner KNEELAND, Peter Eckler, Robert Dale OWEN, and Frances WRIGHT, and was heavily involved with their attempts to found a national freethought society. Vale, according to his contemporaries, was rather "irritable" and had numerous conflicts with them. Despite all their efforts, a true national society of freethinkers did not come about.

TIMOTHY BINGA

VANINI, GIULIO CESARE (1585–1619), Italian freethought martyr. Giulio Cesare Vanini led a brief, picaresque life. His courage facing death at the hands of the church made him a FREETHOUGHT martyr second only to Giordano BRUNO.

Born at Taurisano, Italy, Vanini studied theology and philosophy at Naples and Padua, becoming a Carmelite monk and gaining his doctorate at twenty-one in 1606. Influenced by the writings of John Baconthorp, a fourteenth-century English Carmelite Averroist (see AVERRÖES), Vanini leapt into a European intellectual culture rife with Aristotelian heterodoxy. He studied and taught in a succession of European university towns.

By 1612 Vanini's growing naturalism (see NATURALISM, PHILOSOPHICAL) attracted suspicion. Voyaging to England, he insincerely converted to Anglicanism. Jailed on an unrecorded charge, he contrived to transmit to Rome an offer to return to the Catholic fold. After diplomatic intrigues spanning Italy, France, and England, the Vatican brokered his repatriation in 1614.

In 1615 Vanini published his first surviving work, *Amphitheatrum Æternæ Providentiæ*, or the *Amphitheater.* Superficially an orthodox attack on pagan philosophy, its oblique language actually defended pantheism, SKEPTICISM toward miracle claims (see MIRACLES, UNBELIEF IN), a libertine view of morality, and a challenge to God's existence based on the argument from evil (see EVIL, PROBLEM OF; EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). Vanini's major work, *De Admirandis Naturæ Arcanis*, or the *Dialogues* (1616), continued this attack.

In 1617 Vanini withdrew to Toulouse under the pseudonym Pompeo Ugilio. On August 2, 1618, he was arrested on charges of ATHEISM and BLASPHEMY based on an associate's recounting of a private conversation. Historians differ whether the authorities at Toulouse recognized that they were trying Vanini, author of the *Amphitheater* and the *Dialogues.* At his trial Vanini/Ugilio eloquently maintained his theism. But his arguments emphasizing signs of design in nature could have been made by any deist or pantheist; the judges condemned him.

Vanini's comportment facing death cemented his fame. Immediately after sentencing on February 9, 1619, he was drawn through the streets of Toulouse wearing a placard reading "Atheist and blasphemer." Disarmingly calm before the executioner, he resolved "to die as becomes a philosopher." His tongue was cut out and he

was strangled, his body burned, and the ashes scattered. He was thirty-three.

After his execution the church burned multiple copies of the *Amphiteater* and *Dialogues*; other works may have been lost utterly.

Together, Bruno and Vanini mark medieval ecclesiasticism's last opportunities to resist philosophical and scientific naturalism by taking human life. On September 24, 1868, a bust of Vanini was installed in a district hall near his birthplace. His rehabilitation was complete.

TOM FLYNN

VAN PRAAG, JAAP (1911–1981), Dutch humanist organizer. Jaap van Praag was born on May 11, 1911, in Amsterdam. He grew up in a secular Jewish and socialist family. Mainly through his mother and by much reading he acquired considerable knowledge of the Bible. He studied Dutch literature, philosophy, and history, and became a teacher in a secondary school. Until World War II he was extremely active in pacifist and socialist associations, concentrating mainly on peace-related issues and nonviolent resistance. In these associations he met many people who were later also to become active in the humanist movement (see HUMANISM). As a Jew, he was obliged to go into hiding during the German occupation of the Netherlands, which he did from 1943. The horrors of the war were essential to forming his later militancy and worldview. He went back to teaching from 1946 to 1954. From 1954 to 1974 he was on the executive board of the provincial government of South Holland.

Organizer. Immediately after the occupation, he was the most important initiator in founding the Humanistisch Verbond (HV, Dutch Humanist Association) in 1946. He was its chairman from 1946 to 1969; through his charisma, strategic insight, and diplomatic approach he succeeded in building up the Verbond. He was widely considered to be the "father," the "architect," and the "master builder" of organized humanism in the Netherlands. He had two motives for founding the Verbond. First and principally, he wanted to create a LIFE STANCE shelter for the large group of churchless people who were seeking meaning in life as religion declined and wanted to make people morally resilient. He also wanted to work for equality for humanists and other churchless people in a society that legally privileged Catholicism and Protestantism. Mainly thanks to Van Praag's organizational capacity, this endeavor was ultimately extremely successful (see NETHERLANDS, THE, HUMANISM IN). Van Praag also played a crucial role in bringing together humanist people and organizations from all parts of the world, especially in terms of content. He was one of those responsible for founding the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU) in 1952. He chaired the IHEU for twenty-three years, from its start until 1975, during which time his main efforts focused upon keeping the IHEU alive, often with great difficulty, and upon extending it. He enthusiastically established contacts with others, for example, the Vatican, and the Marxists in Yugoslavia.

The Foundations of Humanism. Even during the occupation, he started work on his theory of humanism. His *Modern humanisme: Een renaissance?* (Modern Humanism: A Renaissance?) was written in that period, and published in 1947. In this book he argues for a radical renewal of moral life in the Netherlands, in particular among the unchurched. For the practice of humanist moral counseling, he developed a theoretical underpinning and a methodology as early as 1953, which long served as a basis for this work. Van Praag's importance for the theory of humanism has been great. He was responsible for naming the theory of humanist counseling in the Netherlands "humanistics." Humanistics has become a profession or discipline dealing with the basic phenomena of humanism (see NETHERLANDS, THE, HUMANIST EDUCATION IN). Van Praag himself was professor of humanistics at Leiden University from 1964 to 1979. The book *Grondslagen van humanisme; inleiding tot een humanistische levens—en denkwereld* (Foundations of Humanism: Introduction to a World of Humanist Living and Thinking), published in 1978 (published in English by Prometheus Books in 1982), can be considered a worthy conclusion to a lifelong devotion to the organization and theory of humanism. The book states clearly what Van Praag considered the core of humanism, namely, to oppose indifference and moral emptiness and to encourage solidarity and human resilience as fundamentals for a democratic constitutional state. Jaap van Praag died on April 12, 1981.

BERT GASENBEEK

VERIFICATIONISM. The philosophical movement verificationism claimed that for any proposition to have substantive content, it must be *verifiable*: that is, either con-

firmable or disconfirmable by at least some conceivable experience. In this way, to be intelligibly substantive, propositions must stand up to the tribunal of experience. If nothing either directly or indirectly empirically discernible counted either for or against them, the alleged positions in question were taken to be unintelligible: not genuine propositions at all.

I

Verificationism has had—and is still having—its ups and downs. With David HUME it had its first clear articulation; again, it found clear expression in the late nineteenth century in the writings of the German physicist Ernest Mach. Hume and Mach were important precursors of the movement variously called logical empiricism, LOGICAL POSITIVISM, or scientific empiricism. It had its earliest articulation in Scandinavia among social scientists, legal theorists, and philosophers in the circle around the Swedish philosopher Axel Hägerström, and then somewhat later among the so-called Vienna Circle and the Berlin Circle (see SCHLICK, MORITZ, AND THE VIENNA CIRCLE). It flourished principally under the influence of Rudolf Carnap, Moritz Schlick, Otto Neurath, Hans Reichenbach, and Carl Hempel; it was exported to the United Kingdom chiefly by A. J. Ayer. In North America, mostly in the United States, verificationism followed a somewhat different path, initially as an independent development by the pragmatists, principally Charles Sanders Peirce. With the onset of World War II, most of Europe's logical positivists moved to the United States, where they became a powerful philosophical force, joining with the pragmatists whom they regarded as their well-meaning but rather fuzzy colleagues. Ernest NAGEL and Sidney HOOK, two of John DEWEY's most talented students, were also influenced by logical positivism and developed distinctive accounts of verificationism.

With all these philosophers and the philosophical movements developing around them, verificationism flourished—most notably among the logical positivists who were at the cutting edge of the development of analytic philosophy from the 1930s to the 1960s. But it is also important to note in their actual practice, though not in programmatic articulation, verificationism was extensively employed in the work of Ludwig Wittgenstein and the philosophers under his influence, and by Gilbert Ryle and the so-called ordinary language philosophy practiced mainly at Oxford, though with considerable importance in the United States. All of those philosophers would disdain calling themselves verificationists, or for that matter disdain any labeling. But they deployed verificationist arguments repeatedly and at crucial junctures in their thought.

For all the logical positivists from Hägerström to Carnap (as with Hume and Mach as well), their verificationism carried with it a thorough rejection of religion and metaphysics. These were regarded as illusions to be firmly set aside—indeed, their key propositions were regarded as cognitively unintelligible pseudo-propositions.

II

So with logical positivism and Wittgensteinianism dominating the first stage of analytic philosophy, verificationism was in the ascendancy. However, in the mid-1950s verificationism, ordinary-language philosophy, and even Wittgenstein began to lose favor. By around 1960 verificationism was no longer in the ascendancy. Its decline was thought to have occurred principally through criticism from within. The logical positivists themselves, ever committed to clear articulation and rigor, realized that they were not able to articulate satisfactorily the verifiability (testability) principle central to their thought. When they attempted to do so, they came up with formulations (as we shall see) that were either too strict—ruling out plainly meaningful scientific and commonsense propositions as unverifiable—or too liberal, letting in the very metaphysical propositions the criterion was constructed to exclude.

It was also the case that philosophers such as Martin White, W. V. O. Quine, Frederich Waismann, and Stephen Toulmin showed that the allegedly firm distinction between the analytic and the empirical was little more than a dogma. In this onslaught on a distinction much heralded by positivists, Quine's attack was by far the most thorough and distinctive. But the others contributed also, in different ways. Third, a form of "scientific realism" or metaphysical realism was coming into favor, receiving careful articulation by analytical philosophers who were often naturalists (David Armstrong, C. B. Martin, J. J. C. Smart, David Lewis) but sometimes theists (Richard Swinburne, Saul Kripke, Robert Adams).

These realists believed that many kinds of things that exist, and what they are like, are independent of us and sometimes even of the ways by which we find out about them or characterize them. These things are there for us to discover, and are what they are independently of how we happen to view them—or even exist so we can view them—for example, trees, lakes, chimpanzees, or Halley's comet. It is either true or false that Mars exists. How we can find out about Mars, or *whether* we can find out, was thought to be another matter entirely. Most—though not all—objects are independent of our thought. We do not bring them into existence or sustain their existence. Verification procedures do not create the objects or states of affairs that they verify—or at least, not most of them. "God exists" (as most other things) cannot be identified with the method of its verification. The *meaning*, or the use, of "God exists" cannot be identified with how or whether we can confirm or disconfirm it. It has a use in the language, and the proposition "God exists" is either true or false in good realist fashion, whether we can know that God exists or not. How we determine whether or not God exists is another matter entirely. What reality is actually like and how we are to

conceive it are typically separate questions. What is real is generally independent of our conceptions of it.

This is what a realist maintains and this, realists claim, verificationists *must* deny. But its denial is too implausible to be credible. This realist view has gained ascendancy, and together with the first two problems mentioned concerning verificationism, has put verificationism on the back burner.

III

We will now examine whether verificationists can adequately respond to these and related criticisms. Both Michael Martin and Kai Nielsen have made detailed and careful responses in defense of both verificationism and of atheism, and Martin as well has made an accurate explication of Nielsen's verificationist account.

We will seek an adequate formulation of the verifiability (testability) principle, moving from the simplest (though still prima facie plausible) articulations to increasingly (at least putatively) more adequate formulations. Remember that all of these formulations begin with the acceptance of something that is broadly an empiricist preanalytic conviction, namely, the conviction that experience is the sole legitimate source of information about the world. Any rationalist or supernaturalist attempt to go around this or beyond this, and say that the world just must be so-and-so or that reality must be such-and-such no matter what we experience, is to say something incoherent. It is to try to gain a kind of knowledge that cannot be had. Our challenge is to articulate verificationism *with* the realist intuitions described above intact (or nearly so), and to show how verificationists do not have to deny those realist intuitions as realists believe they do.

A verificationist starts with the above-stated idea about informativeness and experience, and seeks to set out, in that nonrationalist spirit, a verifiability principle that will serve as a kind of litmus test to sort out what it does and what it does not make sense to say: for example, "Lightning started the forest fire" as distinct from "An unknowable, indescribable ineffable cause started the forest fire." It seeks a general criterion to pick out sense from nonsense. In that spirit our first try at formulating the verifiability principle is this:

1. A proposition is meaningful if and only if it is empirically verifiable.

But this won't work for "2 + 2 = 4" or "all biological sisters are siblings." Both are plainly meaningful, and indeed are true, yet they do not even purport to be verifiable. Moreover, on this articulation of the verifiability principle, certain statements about the past—which, trivial though they be, are plainly meaningful—also become unverifiable under formulation number 1. Consider "Napoleon yawned just twenty times while on Saint Helena's" or "There were only fifteen wild turkeys on Block Island in 1292."

So in the spirit of practically all the logical positivists, we amend formulation 1 to 2:

2. A proposition is meaningful if and only if it is at least in principle verifiable, that is, if it is logically possible to verify it.

Assuming problematically that we have some reasonably clear idea of what it is logically possible to verify and what is not, formulation 2 enables us to say that those truisms about Napoleon and the wild turkeys are each verifiable—for if there had been someone there in the past (and there could have been) concerned to record such trivia, and who had indeed recorded them, and had the record remained intact, we could confirm or disconfirm such propositions. But we are still left with the problem of so-called a priori propositions, so we amend 2 to 3, thereby in effect dropping any claim to having a *general* criterion of what it makes sense to say:

3. A nonanalytic proposition is meaningful if and only if it is at least empirically verifiable in principle.

But we still have problems with plainly intelligible normative propositions such as "Torture is always completely unacceptable" or "Due process must always be adhered to." They at least appear to be unverifiable. The move taken by most of the logical positivists was to amend 3 to 4:

4. A nonanalytic proposition is *cognitively* meaningful if and only if it is at least verifiable in principle.

But this in turn rests on a probably arbitrary or at least very controversial conception of *cognitive*, a conception rooted in a noncognitivist or nondescriptivist understanding of normative utterances that treats them as emotive or prescriptive, or otherwise nondescriptive, utterances without cognitive meaning. But this is very questionable for many moral and otherwise normative utterances, including the two given above. As with mathematical propositions, they are true or false without any concern for such obscurities as mathematical or normative objects or talk of correspondence.

This leads us to 5, something which better captures the underlying intent of the logical positivists:

5. A proposition is factually meaningful if and only if it is at least in principle verifiable.

Point 5 captures their underlying intent, for most crucially they wanted a criterion that would enable us to decide which of the many propositions or sentences

embedded in our cultural space made genuine claims about the physical and social world—that is, claims that could give us empirical information about what that world is like. They wanted a criterion to distinguish factual propositions from pseudo-factual propositions such as the metaphysical and theological monsters of speculative philosophy and of metaphysical religiosity (which just seem to go with Judaism, Christianity, and Islam).

However, as it stands 5 will not quite work; for if we accept 5 as our criterion, all scientific laws and generalizations become unverifiable. Indeed this would be true generally of universal generalizations. If it is said that "All robins in Quebec migrate south in the fall," no amount of observation will verify the truth of that statement—will, that is, establish conclusively its truth—though some possible observations would count for its truth and some against it. But we cannot *conclusively* establish its truth, or that of any other empirical generalization. A nonmigrating robin might turn up in Quebec in the middle of winter that would falsify it. Such a proposition is *falsifiable* but not *verifiable*. This suggests turning the verifiability criterion into a *falsifiability* criterion:

6. A proposition is factually meaningful if and only if it is at least in principle falsifiable.

That may well work for general statements (laws of nature and the like), but clearly it does not work for existential propositions such as "There is at least one rattlesnake in Quebec." We can verify this proposition by, say, seeing a rattlesnake in the woods. But no amount of observation will definitely establish the proposition to be false. Some things will count toward its falsity, but no amount of observation will *conclusively establish* its falsity. An extraordinarily scrupulous and systematic search for rattlesnakes might be undertaken and none might be found, yet a rattlesnake still might turn up in Quebec.

Trying to avoid these difficulties it might seem plausible to propose:

7. A proposition is factually meaningful if and only if it is either at least in principle verifiable or at least in principle falsifiable.

Yet that won't work either, as Hempel pointed out, for the very same reasons as were given concerning the verifiability and the falsifiability criterion. Propositions like "Every substance has some solvent" or "Every democracy has some fascists" are neither conclusively verifiable nor conclusively falsifiable, even in principle.

So strong verificationism will not work. Moreover, the attempt to establish strong verificationism runs contrary to the *fallibilistic* spirit of science. In scientific inquiry—or anywhere else where significant matters of substance are at issue—we simply are not going to achieve conclusive certainty. The most we can reasonably hope for is that we can go on gaining ever more adequate scientific accounts, better philosophical explications, and better accounts of science. This realization led in the first instance to a *liberalization* of the so-called verifiability or falsifiability criterion. The talk now centered on testability—confirmability or infirmability in principle. We can capture this idea in a formulation such as:

8. A proposition is factually meaningful if and only if it is either at least in principle confirmable or infirmable.

The problem here is not that 8 excludes too much—namely, established scientific propositions or well-established commonsense empirical beliefs—as nonsense under that criterion, but that 8 *lets back in* the metaphysical and theological monsters that the logical positivists had set out to exclude. All that is now being asked is that there be *some empirical observations* that are at least logically possible for us to make which could count either for or against a proposition taken to be genuinely factual. But that standard excludes very little. "God is our loving Father" or "God created the heavens and the earth" could be taken to be confirmable or infirmable by 8, and thus to have factual meaning. Human suffering counts against "God is our loving Father," and human well-being counts for it. The great age of the earth and its seeming eternity counts against "God created the heavens and the earth," and the Big Bang counts for it. But nothing counts even *nearly* decisively for or against either proposition. But exactly that is to be expected for 8. On that criterion, some religious and metaphysical propositions become empirically confirmable or infirmable—and *in that* way testable—and thus come to be seen to have empirical and factual meaning. (This has led *some* atheists to conclude that "God created the heavens and the earth" is false, rather than factually meaningless.)

With this chain of formulations we have watched logical positivism develop toward greater logical and empirical adequacy, at the same time losing much of its old antimetaphysical bite. As an exacting program to free the world of metaphysical and religious illusions (and the kind of moral and political illusions that go with them), it seems to have lost its way. This will be returned to in the next section.

But all that aside, it is important to recognize a different kind of difficulty that many have thought to be attached to even the liberalized, testability-in-principle version of verificationism. By 8 "It is not the case that all crows are black" plainly has empirical meaning; but then, it is claimed, so does "Either it is not the case that all crows are black or God is ersatz," on the grounds that it is reasonable to suppose that any logical consequence of a confirmable compound proposition is itself confirmable. Given that, "Either it is not the case that all crows are black or God is ersatz" is confirmable. And if "All crows are black," then "God is ersatz" can be deduc-

tively inferred from it, given the above. Since "God is ersatz" follows from confirmable statements, and thus from factually meaningful statements, "God is ersatz" on this account is confirmable and factually meaningful. But we could substitute any proposition at all for "God is ersatz" in the above argument and get a factually meaningful proposition. But this is a reductio. It looks like the verifiability, falsifiability, and testability criteria are incoherent. Plainly something has gone wrong.

It is difficult not to react by thinking that this is all very artificial and silly word play. But taking it and similar turns at face value, Wesley Salmon has produced a telling response to this. Salmon argues (against the standard interpretation of the propositional calculus) that a factually meaningful compound sentence can have factually meaningless components. Standardly, the propositional calculus tells us that compound sentences must be such that all of their components are either true or false. But whatever is the case in a formal system with its stipulated rules, in natural languages we have compound sentences where that does not follow. "The door is open and close the door" is a compound sentence; but the second component, being an imperative, couldn't possibly be either truth or false. And "Either it is not the case that all crows are black or wrinkler dinkler big" is either not a compound sentence at all (since the second component is meaningless) or it is a compound sentence with a meaningless component. Moreover (and independently of the above) a meaningless component cannot follow from anything, since it is meaningless; being meaningless, we could not even in principle ascertain whether it does or does not follow from anything. Some nonsense is so extreme that we cannot tell whether we even have a sentence rather than a meaningless concoction of words, that is, "Right melancholy equilateral." The standardly accepted moves to show that verificationism leads to absurdities because meaningless strings of words can follow from factually meaningful sentences (for example, those of Alonzo Church) are just so much love's labor lost. But what is important, once we arrive at the liberalized testability criterion of factual meaning, is that we have a metaphysical religious statement "God is our loving Father" which *on that criterion* is confirmable or infirmable and thus has factual meaning. With this, the logical positivist programmatic stance is undermined, for we have shown that at least some religious propositions are factually and empirically meaningful.

IV

Are things really so bleak for verificationism? It could be argued they are not, for the following reasons: (1) Though some religious utterances, embedded as they are in our ordinary language (say, "God is our loving Father"), may be weakly confirmable or infirmable, many less anthropomorphic ones characteristic of what Hägerström called "metaphysical religiosity" are much less evidently factually meaningful. Consider such propositions as "God is the ineffable Other," "God is the sole universe-transcending infinite individual," "God is the foundation of being and meaning," "God is being itself." With such sentences allegedly forming propositions, we *at least* arguably have no understanding of what counts (if anything) for or against them, even weakly. We simply do not understand what they mean or what they are trying to assert. (2) Propositions like "God is our loving Father" are weakly confirmable/infirmable in the way we have indicated. But the above religious propositions and propositions like them do not *follow* from the evidential ones. Moreover, we shouldn't even call them "propositions," for in reality they are meaningless strings of words. The evidential propositions, we should also note, are equally compatible with atheistic or agnostic views and the propositions that express them. Moreover, these secular views are articulated more economically, with fewer problematic assumptions, and arguably answer more fully to reflective human interests than the religious ones. In both common life and in science, it is not infrequently the case (as far as we can ascertain) that the empirical evidence is compatible, even equally compatible (again as far as we can tell), with different claims made in the light of the evidence. But there could be all sorts of other reasons for favoring one account over another: simplicity, fit with other theories, clarity, perspicuous representation, and the like. We are not just stuck with the religious interpretation. (3) To get a firmer grasp on the claims being made by religious utterances, we need something of a sense of what in our experience could count for them or against them. This is why we are not as totally lost with "God is our loving Father" or "We live with God's providential care" as we are with "God is the ineffable Other" or "God is the ultimate ground of being and meaning." But the last two are taken by most theologians to be central claims of (say) the Christian religion and what is shared ground between Judaism, Christianity, and Islam. (4) It is when we articulate a combination of verificationist and nonverificationist arguments that we get the most effective critique of religion. We are told by Jews, Christians, and Muslims that God is a person: an infinite individual who is also a pure spirit utterly without a body and transcendent to the world. In claiming that this is incoherent, it is not verificationist arguments that do the work, for we have no understanding of what verification (or testability) could come to concerning it. God is said to be an infinite individual; but if something is infinite, that reality could not be an individual or a person. And how could a person be "out of the world" but still somehow be acting in it? And how could a person act without a body and even be a person? What would it be for any of these things to obtain? All this (to put it mildly) is utterly mysterious. Words cannot intelligibly be put together in these ways. Finally, we have no understanding of what it would mean to be transcendent to the world: to be beyond space and time. It is not verificationist (or testability) considerations that tell us that such

talk is meaningless—indeed, pure gibberish—but rather attention to the logic of our language. But verificationist (or testability) considerations enter this discussion in other ways. Someone says he has apprehended God, or experienced God in his life, or that he lives in the presence of God, or that God loves him. Here we can relevantly ask what (if anything) counts for or against such claims and, if anything does, how strongly?

Finally we should look at a consideration that is a favorite among the traditionalist critics of the verifiability (testability) criterion of meaning (such as F. J. Copelston or A. C. Ewing). It is said by them (and not only by them) that this criterion is self-refuting. The verifiability (testability) principle is neither analytic nor a factual empirical proposition, so it is on its own account meaningless or at least cognitively meaningless. But it is not. It neither purports to be analytic, nor in any other way (if there is another way) a priori, nor an empirical assertion, nor any other kind of assertion. It is rather set forth as a proposal as to how to take or construe our language, and as to how to decide what makes sense and what does not. It is not a principle making an assertion which is true or false either analytically or empirically, but as a pragmatic proposal for how to decide which of those myriad noises or marks we make in speaking or writing make sense. Of that great jumble of sentences that we are faced with and deploy, which of them should we take as making sense and in what ways, and which ones are to be rejected as incoherent or meaningless? We are looking for a criterion (perhaps more than one) which we judge in terms of its utility, economy, and perspicuousness, and do not regard as something that can be either true or false any more than we regard "Let's go to Ireland in October" as true or false. Proposals do not have truth conditions or assertability conditions, but are still intelligible.

Others, of course, can make their proposals too, but they, logical positivists plausibly claim, will lose out to the verificationists, when their aim is to gain criteria for what it is to come to understand what it is to make intelligible and sound claims about the world, where the only source of information about the world is experiential in the broad Deweyian understanding of "experiential." And that last claim—a core claim of any empiricist and naturalist—is either true or false. Verificationists place their bets on its being true. It is a point they make for which there is a lot of indirect empirical evidence. It is, to put it mildly, hard to understand what it is to have a nonexperiential grasp of the world.

KAI NIELSEN

VOLTAIRE (FRANÇOIS MARIE AROUET; 1694–1778), French philosopher, historian, poet, and satirist. A pioneer in the development of a largely secular vision of human existence, Voltaire strongly criticized religion and religious fanaticism, waging a particularly vigorous campaign on behalf of religious toleration.

In assessing the course of Voltaire's life, it must be kept constantly in mind that he was living at a time when France was dominated by two overwhelmingly powerful forces—the monarchy and the church—which, both separately and in unison, held a stranglehold on all literary and political expression. In spite of his early success as an author (chiefly as a tragic playwright) and the large sums of money he made from his bewilderingly vast array of writings, Voltaire was in constant danger of imprisonment for perceived political and religious offenses in what today seem quite harmless literary works. His nearly sixty years as an engaged public intellectual were repeatedly filled with bold and, at times, reckless attacks upon the establishment.

Life and Work. Born in Paris, Voltaire was educated at a private school, Louis-le-Grand, which, although run by Jesuits, nonetheless produced several leading freethinkers of the period (see FREETHOUGHT), including Denis DIDEROT and Claude Adrien HELVÉTIUS. At the age

of seventeen he began attending informal meetings of a group of freethinkers led by Philippe de Vendôme, at the same time developing his early interest in verse satire. An early poem, "*Le Vrai Dieu*" (The True God, 1715), points out the paradoxes involved in the Christian conception of a god immolating himself for the sake of sinners. Voltaire gained celebrity with the verse drama *Oedipe* (1718), a treatment of the Oedipus legend that indirectly expressed impatience with the stifling political and moral authority exercised by the church. Another early poem, *Epître à Uranie* (Epistle to Urania), written in 1722, presented an exhaustive condemnation of Christianity as both unjust and unreasonable—two dominant themes in Voltaire's later religious criticism. It was published surreptitiously in 1732. Another celebrated early work, the epic poem *La Henriade* (1723), although ostensibly a patriotic poem about Henri IV, presented a warning on the dangers of religious fanaticism, especially in its depiction of the bloody massacre of Saint Bartholomew in 1572.

Because he had offended a nobleman, Voltaire was forced to spend the years 1726–29 in England. There he was befriended by Lord BOLINGBROKE and other leading British intellectuals, and he came into first contact with the philosophy of John LOCKE and the science of Sir Isaac Newton. Tremendously influenced by the greater religious toleration found in the British Isles, Voltaire wrote the *Letters concerning the English Nation* in English (1733); a French version, *Lettres philosophiques*, appeared the next year, in which Voltaire's searing criticism of Pascal's religious dogmatism and obscurantism was added as an appendix. The French edition created an uproar and was publicly burned—a fate that would overtake a number of Voltaire's later works. It was also in England that Voltaire commenced his first major historical work, *Histoire du Charles XII* (1731).

Much of the period between 1734 and 1750 was spent at various country estates of wealthy aristocrats around Paris: Voltaire's work had already become so controversial, and had so offended the new king, Louis XV, that he could not enter Paris without the threat of imprisonment. In spite of his prodigious literary output, Voltaire did not neglect his personal life: aside from various short-term affairs with married noblewomen, he established two long-term romantic involvements, first with Madame du Châtelet (at whose estate at Cirey he spent most of the years between 1734 and 1744), and then with his own niece, Madame du Denis. He continued the writing of verse tragedies, including *Mahomet* (1741) and *Mérope* (1743), both of which continue to hammer home the horrors of religious fanaticism. *Mahomet* suggests that Islam (and, by implication, Christianity) is founded upon credulous belief in false miracles.

In 1750 Voltaire accepted an invitation by Frederick the Great of Prussia to stay at his court; previous correspondence with Frederick had led Voltaire to believe that he may have found his ideal of a philosopher-king, but the three years spent with Frederick convinced him otherwise, and he came to regard this royal dabbler in poetry and music as merely a duplicitous hypocrite. Although Voltaire published the flattering *Le Siècle de Louis XIV* (The Century of Louis XIV, 1751), a landmark work of historiography, Louis XV was so offended by Voltaire's abandoning France to go to Prussia that he forbade him to return to his native country. By 1755 Voltaire had settled in Geneva, thinking he had found a haven of religious and political toleration; but once again his hopes were dashed, and his continual offending of the Calvinist sensibilities of the Genevan ruling class forced him to purchase the estate of Ferney just across the Swiss border in France. This became Voltaire's home from 1758 to the end of his life; it also became a place of pilgrimage for numerous intellectuals from around Europe, and Voltaire would receive his guests as if he were himself a philosopher-king.

The year 1755 was traumatic for Voltaire on several counts. In November the Lisbon earthquake occurred, and its horrific death toll, numbering in the tens of thousands, was augmented by the fact that it had taken place on a Sunday, so that many people had died while in church. Voltaire, among many others, was shaken to the core: how could a benevolent and all-powerful god have allowed such a thing to happen? His searing poem, *Poème sur la désastre de Lisbonne* (Poem on the Disaster of Lisbon, 1755), contains some of his most plangent queries on the problem of evil. It was in 1755, also, that his scandalous poem *La Pucelle*, usually translated as *The Maid of Orleans,* was published in an unauthorized version: this mock-epic in which Joan of Arc spends all her time desperately protecting her virginity took aim at one of the sainted figures of French history, and it could not have helped Voltaire's attempts to ingratiate himself into the good graces of the king. His popularity, however, continued to increase, and he gained many new readers with a new literary genre he virtually created out of whole cloth, the *conte philosophique* (philosophical tale), the most celebrated example of which is the short novel *Candide* (1759), which pungently destroys Gottfried Wilhelm von LEIBNIZ's abstract arguments that, given an omnipotent and benevolent god, the earth as it exists must be the "best of all possible worlds."

In 1762 the case of Jean Calas broke. This hapless Protestant was accused of murdering his son because he had suspected him of secretly converting to Roman Catholicism. Calas was subsequently tortured and executed. Voltaire immediately turned his attention to the case, quickly discovering that Calas had been unjustly accused; he ultimately prevailed to the extent of securing a posthumous clearing of Calas's name in 1765. Another case involved Elizabeth Sirven, a young Catholic woman who was found dead in a well, leading to the accusation of her Huguenot family for her murder. This case occupied much of Voltaire's time all the way up to

1775, leading again to the family's exoneration. The chief result of all this work, however, was the imperishable *Traité sur la tolérance* (Treatise on Toleration, 1763), a pioneering work whose effects were immediate and pronounced.

The 1760s marked a period of unexampled productivity for Voltaire: among the major works produced at this time were the *Dictionnaire philosophique* (Philosophical Dictionary, 1764), later placed upon the church's Index of forbidden works; the *Philosophie de l'histoire* (Philosophy of History, 1765); *Questions sur les miracles* (Questions on Miracles, 1767); *Examen important de milord Bolingbroke* (Lord Bolingbroke's Important Examination, 1767), his broadest attack upon Christianity; and *Dieu et les hommes* (God and Men, 1769), an exhaustive and acerbic survey of religion from India to the Middle East to Judaism and Christianity. Although continuing to write, Voltaire found his health increasingly failing. He expressed a longing to return to the Paris that he had not seen in decades, and in early 1778 he surreptitiously crept back into the city. But his presence could not long be kept secret, and he was received with enthusiasm by populace and intelligentsia alike—by all, in short, except the court and the church. Voltaire died in Paris on May 30, 1778.

Fundamentals of His Thought. Voltaire called himself a deist (see DEISM); on occasion he would actually use the word *theist* as a synonym. In the *Dictionnaire philosophique* he defines a "theist" as "a man firmly convinced of the existence of a supreme being as good as he is powerful, who has created all extended, vegetating, sentient and thinking beings, who perpetuates their species, who punishes crimes without cruelty, and benevolently rewards virtuous behavior." In spite of the skepticism of Voltaire's leading scholar, Theodore Besterman, who maintained that Voltaire was for all practical purposes an atheist, there is little reason to doubt that he adhered sincerely to this conception of deity. Elsewhere in the same work, in the entry "Faith," Voltaire states: "It is evident to me that there is a necessary, eternal, supreme, intelligent being. This is not a matter of faith, but of reason." From the sum total of Voltaire's remarks, it appears that he was driven to postulate a "necessary" supreme being because he could see no way around the adoption of the argument from design: as he states in the entry "God, Gods" in the *Dictionnaire philosophique:* "Every construction which displays means and an end announces an artisan; therefore this universe, composed of mechanisms, of means, each of which has its end, reveals a very powerful, very intelligent artisan." Voltaire's repeated criticism of the more forthright atheism of Baron d'HOLBACH, Helvétius, Julien Offray de LA METTRIE, and others makes it abundantly clear that he did not wish to be considered in their camp.

Voltaire also considered belief in a supreme being, especially one who rewards virtue and punishes sin, as necessary to the maintenance of the social order. In this stance there was a certain cynicism, for Voltaire often stressed that this belief, even if false, was nonetheless *useful.* This is the basis for his celebrated statement (embodied in a letter of November 1, 1770): "If God did not exist, it would be necessary to invent him."

The distinction between deism and atheism is most clearly expressed in the short story "L'Histoire de Jenni, ou l'athée et le sage" (The History of Johnny, or the Atheist and the Sage, 1769; see ATHEISM). In this *conte philosophique*, the "sage," Mr. Freind, presents what are manifestly Voltaire's arguments in support of a deity, specifically the argument from design and the need to preserve good morals. When his opponent, the atheist Birton, responds that the universe appears to have come about of its own accord and that the existence of natural and human evils mitigates against the notion of a benevolent deity, Freind replies with the standard argument that human beings have brought evil upon themselves through an abuse of free will. Freind wins the argument with surprising ease, and Birton is converted to deism. The entire story portrays atheists as unprincipled libertines interested only in their own pleasure, who commit crimes with insouciance because they fear no retribution from God.

At the same time that Voltaire defended deism, he ruthlessly condemned the very foundations of the Christian religion. The belief that Voltaire was merely criticizing the excesses of Christianity—its persecution of heretics and infidels, its exercise of secular power—cannot be maintained in the light of such works as *Examen important de milord Bolingbroke* and *La Bible enfin expliquée* (The Bible Finally Explained, 1776), both of which are merciless in their examination of the errors, paradoxes, and inconsistencies in both the Old and New Testaments. The *Dictionnaire philosophique* entry on "Genesis" exhibits the contradictions to known laws of entity found in the creation story in Genesis, while the entry on "Julian" presents a sympathetic portrayal of the Roman emperor who tried to stop the spread of Christianity. Other works, such as the *Essai sur les moeurs* (Essay on Customs, 1756), were radical in their refusal to single out Christianity for privileged treatment, instead regarding the Christian religion as just one component in the universal history of humankind.

In Voltaire's eyes, other religions such as Judaism and Islam were just as irrational and absurd. His celebrated cry, "Écrasez l'infâme" (Crush the infamy), which he uttered hundreds of times in letters and public documents from the late 1750s onward, appears to refer specifically to religious superstition, but can be taken broadly as a condemnation of all fanaticism, whether political or religious. Voltaire was one of the first to adopt the anthropological method of accounting for the existence of religious belief: in the *Philosophie de l'histoire* he makes plain his belief that religion emerged in primitive times as a means of explaining and placating natural phenomena.

But Voltaire is perhaps best remembered for his unfailingly witty lampooning of the absurdities of religion, specifically of Christianity. Far more than Democritus, he deserves the appellation of "the laughing philosopher." While it is evident that Voltaire's raillery was strongly supported by learning and conviction, there is no denying the entertainment value of such works as *Le Taureau blanc* (The White Bull, 1774), in which the Witch of Endor comes to Egypt with a motley crew of animals—the serpent that tempted Eve, Balaam's ass, the fish that swallowed Jonah, Tobit's dog, and the like—in tow. The serpent presents a valiant defense of his urging Adam and Eve to eat of the fruit of the tree of knowledge ("Would the Supreme Being have wished to have been served by fools and idiots?"), while a raven tells of how Noah accomplished the prodigious feat of feeding all the animals on the ark for ten months. Voltaire's universalist perspective on religion is exemplified in the philosophical tale *Micromégas* (1752), in which an inhabitant of the star Sirius comes to Earth and notes with bemusement an array of human follies, many of them inspired by religious dogma and intolerance.

Voltaire's most immediate influence upon social, political, and intellectual history was in his fiery pleas for religious toleration. His involvement in the Calas and Servin cases in the 1760s and 1770s made it clear to him that the power of religious authority to enforce its dogmas by the use of deadly force was an unmitigated evil and must be curbed. And yet the *Traité sur la tolérance* presents some unexpected arguments for religious toleration. Unlike John Locke (*Epistola de tolerantia*, 1689), Voltaire places no particular emphasis on the need to preserve the separation of church and state; nor, like Pierre BAYLE, does he defend tolerance on the grounds of individual liberty of conscience. Following contemporary British example, which gradually removed civil disabilities from dissenters but still prohibited individuals not members of the Church of England from holding public office or even from practicing their religion openly, Voltaire presented the case for toleration as a means of maintaining social order: an established church is not in itself an evil, so long as it is not fanatical, superstitious, or intolerant. Far from recommending a strict separation of church and state, Voltaire maintained that the government should be used to restrain individual churches when they sought to inflict harm upon individuals for mere violations of religious dogma.

Although the core of Voltaire's views on religion can be found in the *Dictionnaire philosophique*, the *Philosophie de l'histoire*, the *Traité sur la tolérance*, and other well-known writings, the full scope of his criticism of religion in general, and Christianity in particular, cannot be grasped by English-speaking readers because many of his most substantial works—the *Examen important de milord Bolingbroke*, *Dieu et les hommes*, and *La Bible enfin expliquée*—have either never appeared in an English translation or have not been translated for well over a century. With the slow but steady publication of Voltaire's works in sound editions by the Voltaire Foundation, it is hoped that new translations of these and other works will be made available so that the dynamic, controversial, and pungently witty work of the eighteenth century's most celebrated public intellectual can be fully appreciated.

S. T. JOSHI

WAISBROOKER, LOIS (1826–1909), American suffragist and sex radical. Little is known about Lois Waisbroker's early life. She was born Adeline Eliza Nichols in Caroline, New York, to Grandison and Caroline (Reed) Nichols. The Nichols family moved to Dover Township in Cuyahoga County, Ohio, around 1839. Adeline's mother died and her father remarried. Adeline married George Fuller and had two children, Pauline and Abner. Fuller died in 1846. Adeline worked constantly as a domestic servant and was often ill, and because of this was forced to give up her children. In 1856 she married Isaac Snell, about whom nothing more is known. Sometime after 1860 Adeline changed her name to Lois Waisbrooker, but it is not clear why.

Averse to the life of a servant, Waisbrooker began formal education in 1852 and taught African American children in country schools. One Sunday she had a "revelation" in church while listening to a sermon. She realized she could do a better job of teaching than the minister could, and questioned why being a woman should stop her from doing so.

Waisbrooker began lecturing and writing on women's rights in the late 1860s, and continued to radicalize. By 1892, while Moses HARMAN was preoccupied with trials and jail sentences as a result of violating the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF), Waisbrooker took over as publisher of Harman's journal *Lucifer, The Light Bearer* (see SEX RADICALISM AND UNBELIEF), to which she was already a regular contributor. She defiantly took up where Harman left off, writing about sex, sexual servitude, rape, prostitution, and similar topics. She printed a graphic excerpt from a Department of Agriculture report on horse breeding and the care of horse penises. That issue of *Lucifer* was banned by the Post Office. Two years later, she was

arrested and charged with publishing obscenity in connection with an article printed in her own journal *Foundation Principles.* The charges were dropped after two years. Afterward, she moved to an anarchist colony in Home, Washington, and published *Clothed with the Sun,* an anarchist-feminist journal. She was again charged with obscenity for publishing an article called "The Awful Fate of Fallen Women," and was found guilty and fined a hundred dollars.

Audaciously freethinking, Waisbrooker wrote several pamphlets and articles against God and the church, including "The Curse of Godism" (*Foundation Principles*, 1884), "The Folly of Worship" (speech before the 1891 Liberal Convention, Ottawa, Kansas, 1891), and "The Curse of Christian Morality" (published after her death in the *American Journal of Eugenics*, 1910). Much of her writing about women and sex included attacks against God, and her novels also included such principles.

Waisbrooker moved to Denver in 1904 and, although her health deteriorated, she continued to write prolifically. She died at the home of her son, Abner, in Antioch, California, on October 3, 1909.

JULIE HERRADA

WAKEMAN, THADDEUS BURR (1834–1913), American freethought activist and scholar. Thaddeus Wakeman was born on December 23, 1894, at Greenfield Hill, Connecticut. Calamity compelled the family's removal to a hardscrabble life in central New York when Wakeman was seven. In his late teens he moved to New York, later enrolling at Princeton to study for the ministry. He graduated with honors at age twenty, convinced by what he had learned that Christianity was untrue. He turned to the law, gaining admission to the bar in 1856.

Wakeman first won attention as an abolitionist. After the Civil War his interests turned to FREETHOUGHT. He was a leader in New York's Humanity Society, served as president of the influential New York State Freethinkers' Association, and succeeded Elizur WRIGHT as president of the NATIONAL LIBERAL LEAGUE, then America's foremost freethought organization. He was *TRUTH SEEKER* founder D. M. BENNETT's attorney during his prosecution under the Comstock Act for selling the birth control pamphlet *Cupid's Yokes* (see COMSTOCK, ANTHONY, AND UNBELIEF). Wakeman organized a national petition drive entreating Congress to repeal the Comstock Act. Wakeman's activism against Comstockery—which suggested to some that freethinkers favored distributing obscene matter through the mails—and his efforts to build a freethinking political party around such issues prompted Robert Green INGERSOLL to resign as vice president of the National Liberal League in 1880.

As an independent scholar, Wakeman distinguished himself by translating many of the works of Johann Wolfgang von GOETHE and writing a naturalistic account of the origins of Christianity influential among freethinkers of his time. He also wrote interpretive works designed to reconcile the European POSITIVISM of Auguste COMTE with the emerging American Socialist movement (see SOCIALISM AND UNBELIEF). From 1899 to 1904 Wakeman served as president of Liberal University at Silverton, Oregon, and later Kansas City (see LIBERAL, KANSAS), and assumed editorship of its paper, the *Torch of Reason.* Thereafter he edited a Chicago-based publication called the *Liberal Review* from 1904 to 1906.

A perennial convention speaker, Wakeman delivered funeral addresses for numerous deceased freethought leaders. He died on April 23, 1913.

TOM FLYNN

WALKER, THOMAS (1858–1932), Australian lecturer and reforming politician. Thomas Walker's mercurial and initially controversial career paralleled the fortunes of organized freethought in Australia.

Born in Preston, Lancashire, England, to Thomas and Ellen Walker on February 5, 1858, in his teens Walker was a Wesleyan lay preacher in England, and by 1872 a farm laborer and Spiritualist medium in Canada (see SPIRITUALISM AND UNBELIEF). He was assisting during an 1874 séance when some phosphorus used for "materializations" ignited and killed his employer. About to be charged with manslaughter, he hastily crossed into the United States, and in 1876 joined the entourage of leading Spiritualist Dr. James Peebles, who went to

Sydney, Australia, as a lecturer in 1877. Walker gave trance lectures there "controlled" by an unusual selection of spirit guides including geologist Sir Charles Lyell, VOLTAIRE, and Giordano BRUNO. From Sydney, Walker moved to the wealthier Melbourne, Britain (1879), and South Africa (1880). He married in Cape Colony in 1881, at which time he was invited to lecture by Australia's Victorian Society of Spiritualists.

In 1882 Walker disavowed mediumistic "phenomena" and broke with the Spiritualists to form the Australasian Secular Association (ASA), of which he became president and lecturer. In retaliation, in 1883 Spiritualist editor W. H. Terry revealed the Canadian episode; Walker decamped to Sydney, where he served as ASA branch president. Two years later he was convicted of exhibiting obscene pictures to promote birth control (see BIRTH CONTROL AND UNBELIEF), resigned as Sydney president, and was expelled from the ASA. He won an appeal against the conviction and affiliated with the Australasian Freethought Union as president, lecturer, and editor of its publication, the *Reflector*. In 1887 he was elected a member of the New South Wales Legislative Assembly and supported trade protection, easier divorce, and other social reforms.

In 1892 Walker accidentally shot a clergyman. He was acquitted of criminal negligence, but convicted of being drunk and disorderly; thereafter he became a florid temperance lecturer. He did not run for parliament in 1894. After a stint in New Zealand as temperance lecturer and elocutionist, in 1899 he went to Western Australia as a journalist covering the Kalgoorlie goldfields. In 1903 he edited a Perth Sunday newspaper, and from 1905 to his death was a member of the Legislative Assembly on the Labor Party ticket. He was also president of the Western Australia Rationalist Association (1918), farmed, and studied law. He held several high government posts, serving as minister for justice and education from 1909 to 1911; attorney general from 1911 to 1916, in which capacity he outlawed capital punishment and cruelty to animals; and Speaker from 1924 to 1930. He died in Perth on May 10, 1932.

DAVID TRIBE

WALLACE, ALFRED RUSSEL (1823–1913), English naturalist, biogeographer. Alfred Russel Wallace was born on January 8, 1823, in the Welsh border village of Usk, the eighth of nine children of Thomas Vere Wallace and Mary Anne Greenell. He described his formal education as worthless, learning far more from his own readings. In 1837 Alfred was sent to London to live with his older brother John. Although he spent only a few months there, this time profoundly influenced him. Attending evening meetings at the Hall of Science, he imbibed the social and political philosophy espoused by Robert OWEN. This was the beginning of the radical and egalitarian ideas that characterized his mature political and social thought. He attended lectures on AGNOSTICISM and SECULARISM and abandoned orthodox religion. That summer Wallace joined his brother William in Bedfordshire to learn surveying and mapping. As he wandered the hills he discovered his passion for nature.

In 1844 he moved to Leicester to teach. After reading Alexander von Humboldt's *Personal Narrative of Travels*—and having previously read Charles DARWIN's *Voyage of the Beagle*—he became determined to find a way to visit South America. He also attended lectures and demonstrations on mesmerism and soon became convinced of its legitimacy. George Combe's *The Constitution of Man*, with its mixture of phrenology and progressive ideas, resonated with his own political views and tapped into his growing interest in psychical phenomena. Robert Chamber's anonymously published *Vestiges of the Natural History of Creation* convinced Wallace that the doctrine of special creation could not possibly be true; thereafter he believed that the problems of natural history would be solved by natural laws, not natural theology.

In Leicester Wallace met the entomologist Henry Walter Bates, and in 1848 the two men went to the tropics of South America. He collected more than 125,000 specimens from the Amazon Basin. Although he lost most of his specimens and almost his life on the return voyage when the ship caught fire, in 1854 he embarked on another major expedition to the Malay Archipelago. In organizing his specimens, he pioneered the study of the geographical distribution of plants and animals that later provided crucial evidence to advance his theory of evolution by natural selection. Wallace noticed a division within the flora and fauna of the Australasian islands that followed a line of demarcation, which today is still known as the Wallace Line. His massive two-volume *The Geographical Distribution of Animals* (1876) entitles him to be considered the founder of the science of zoogeography. His book *The Malay Archipelago* (1869) remains one of the finest scientific travel books ever written. He was also the first prominent anthropologist to live for an extended period among the native peoples whom he studied. He seemed remarkably free of the racism and stereotyping of indigenous peoples that characterized the thinking of the time.

While in the Malay Archipelago Wallace, working independently of Darwin, came up with virtually the identical theory of natural selection. In 1858 he sent Darwin his paper titled "On the Tendency of Varieties to Depart Indefinitely from the Original Type." Not wanting Darwin's priority to be scooped, Charles Lyell and Joseph

Hooker arranged for Darwin's unpublished writings and Wallace's paper to be read jointly before the Linnaean Society. In 1864 Wallace suggested that humans had experienced two distinct stages in evolution. The first stage was just like that of any other organism. But once the human brain had evolved to a certain point and the moral and intellectual capabilities were fairly well developed, natural selection would no longer act on the human physical form, which would remain essentially unchanged. However, in 1869 Wallace claimed that neither natural selection nor a general theory of evolution could account for the origin of consciousness or the higher moral faculties along with various other physical traits.

It has been argued that Wallace changed his mind as a result of his involvement with spiritualism, which began in the mid-1860s, but that is too simplistic an analysis. Wallace insisted his new views were not a negation of the principle of natural selection. Instead, he grounded his argument on the principle of utility alone, maintaining that human beings had a variety of unique traits such as mathematical ability and various aesthetic and moral qualities that would not have been useful in the lowest state of civilization. Some power was guiding evolution in definite directions for future use. Wallace was developing an evolutionary model that was much broader than just explaining change within the physical/biological realm. For Wallace a belief in spiritualism was not incompatible with science. Rather, he wanted the boundaries of science to be extended to include phenomena that could not be explained in strictly materialistic terms.

Spiritualism provided Wallace with a practical morality that resonated with his egalitarian views, his sense of justice, and his unequivocal idealism and optimism regarding the future of the human race. Along with spiritualism, his involvement with various movements including land nationalism, women's rights (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF), and socialism (see SOCIALISM AND UNBELIEF) diminished his stature as a scientist. However, Wallace continued to publish first-rate work in biogeography that made no reference to his spiritualist beliefs. Few naturalists have made greater contributions than he in understanding the natural world.

SHERRIE LYONS

WANG CH'UNG (c. 27–100 CE), Chinese philosopher. Wang Ch'ung has become considerably better known in China since the revolution than at any other time since his death. He was one of the earliest opponents of any kind of superstition, and, conversely, one of the foremost exponents of rationality anywhere in the world in his time.

An orphan, he attended the national university after school and then became a civil servant, working mainly in the educational field. He became assistant to an inspecting censor, but then returned home to write and teach. He was known to be a quiet scholar and a devoted teacher. His main work, *Lun-heng*, contains eighty-four chapters in thirty books. It is usually translated as *Critical Essays*, but *Balanced Inquiries* is a title more in keeping with Wang's declared intention, which was to provide a balanced (or fair) discussion.

His criticisms were essentially of the developments in CONFUCIANISM during the 100 to 150 years prior to his birth. These changes seemed to him to be intellectually arid and therefore academically unacceptable. In particular, he wrote strongly against the belief that heaven was more than just the symbol of perfection described by Confucius. It was being endowed by later Confucians with purposiveness, imagined as possessing a will of its own that it displayed through miracles, portents, and prodigies. Wang rejected all these concepts as irrational, arguing that it was a pathetic fallacy to attribute teleology to the impersonal universe. He rejected the view of many of his contemporaries that Confucius was not merely a supreme sage, but worthy of deification. Wang insisted that Confucius's teaching should be judged by the *Analects*—compiled soon after the Master's death—not by the apocryphal literature written during the two centuries before Wang's birth. Thus fortune and misfortune are to be accepted as the consequence of chance, so that no "meaning" should be read into events nor lessons drawn from them. He argued further that nobody possesses an immortal soul (and therefore nobody becomes a "ghost" after death): the many around him who thought otherwise, he criticized for indulging in nothing less than wishful thinking.

Wang thus emerges as the Chinese CARVAKA or perhaps the Chinese LUCRETIUS. He stands out as a thoroughly independent thinker, borrowing frequently from the Confucian, Taoist (see TAOISM, UNBELIEF WITHIN), and Yin-Yang schools, but writing of them critically, and showing an interest in human institutions rather than metaphysics.

His basic contribution to Chinese thought, therefore, was to clear away the superstitions, beliefs, and dogmas that had developed over two centuries, and to enhance critical and rational thinking—seeds of which were being sown during his lifetime—by espousing an attitude of SKEPTICISM and NATURALISM that was to develop further among his successors during subsequent centuries. Thus he fostered a new ethos of inquiry rather than any specific field of research. For this he was known as one of the three geniuses of his time.

RAY BILLINGTON

WASHBURN, LEMUEL KELLY (1846–1927), American freethought editor and lecturer. Born in Wareham, Massachusetts, the youthful L. K. Washburn failed in his plan to become a lawyer; a few months in a Unitarian seminary convinced him he could never be a Christian minister. Yet in 1870 he successfully pastored a Unitarian congregation for one summer (see UNITARIANISM TO 1961), then began preaching at a hall in Ipswich, at whose pulpit he was ordained without joining any denomination. He preached in a controversial, socially radical vein for ten years, abandoned the ministry and took up bookkeeping, then surfaced as a freethought lecturer. Beginning in 1886 he delivered more than one hundred FREETHOUGHT lectures in Boston's Paine Hall, which had been erected by officers of the important freethought paper, the *BOSTON INVESTIGATOR*.

Upon the death in 1899 of Horace Seaver, second editor of the *Investigator*, Washburn was invited to succeed Seaver as editor, and oversaw the aging paper's final issues and its 1904 absorption by the still-vital national freethought paper, *THE TRUTH SEEKER*.

Washburn was a moderately successful freethought lecturer with liberal affinities to social reform causes. Oddly, his social rhetoric sometimes echoed proponents of the social gospel movement. In 1911 he published his only book, a collection of essays and aphorisms titled *Is The Bible Worth Reading?*

Washburn moved to Revere, Massachusetts, where he remained active as a freethought lecturer and a real estate agent until about 1920. He died in 1927, already largely forgotten; his newspaper obituary amounted only to a few lines.

TOM FLYNN

WATSON, JAMES (1799–1874), English publisher and reformer. Though he wrote little himself, James Watson was a fearless publisher of radical FREETHOUGHT books and magazines, serving as the bridge in an "apostolic succession" from pioneer publisher Richard CARLILE to the RATIONALIST PRESS ASSOCIATION. While writers of controversial works might escape detection and punishment, printers and booksellers like Watson had premises and were thus sitting ducks.

Watson was born in Malton, Yorkshire, on September 21, 1799. Educated by his mother, a Sunday school teacher, and in charity schools, at age twelve he briefly entered domestic service with a clergyman. After five years as an agricultural laborer he became a warehouseman in Leeds and met artisans studying works by Thomas PAINE and other deists (see DEISM). In 1822, while Carlile was in jail, he went to London as one of many shopmen carrying on the business and was prosecuted in turn for issuing Elihu PALMER's *Principles of Nature* (1801) in 1823. During his year in jail for "blasphemous libel" (see BLASPHEMY), he turned to "heavy" reading like the philosophy of David HUME and the histories of Edward GIBBON.

On his release, Watson studied printing and became compositor for Carlile's *Republican* and *Lion*. In 1826, he narrowly survived cholera, joined the Owenites (see OWEN, ROBERT), and was a storeman in the First Co-operative Trading Association. From 1827 he was wealthy freethinker Julian Hibbert's printer, and was active in agitation for female suffrage (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF), trade union formation, and abolition of the 1819 "taxes on knowledge" (duties on advertising and paper and a newspaper stamp). In 1831 he narrowly escaped jail for ordering a feast on a fast day. Hibbert gave him type and presses to issue Comte de Volney's *Lectures in History.* He continued releasing other heterodox literature and his own paper, the *Working Man's Friend* (1832–33). In 1833 he served six months' jail time for publishing Henry HETHERINGTON's unstamped *Poor Man's Guardian* (1831–35). With a 450-guinea bequest from Hibbert, he launched a "Cabinet of Reason" series in 1834.

Meeting William Lovett, he became an active Chartist. He also met George Jacob HOLYOAKE and printed the *Reasoner* from 1846 to 1854, when, helped by a 250-pound subscription, Holyoake bought his business. Still committed to reform and press freedom, Watson was the first president of the London Secular Society in 1853, treasurer of the Truelove Defense Fund in 1858, and supporter of the Charles BRADLAUGH

Defense Fund in 1868. He died in Norwood on November 29, 1874.

DAVID TRIBE

WATTS, CHARLES (1836–1906), English writer and lecturer. Linking SECULARISM to RATIONALISM, possessing many talents, and establishing what amounted to a dynasty, Charles Watts would undoubtedly enjoy a higher reputation had he not fallen out with Charles BRADLAUGH in the middle of his career and been eclipsed by his son, Charles Albert WATTS, at the end.

Charles Watts was born in Bristol on February 27, 1836, the son of a cobbler and Wesleyan lay preacher. He showed an early interest in debating, temperance lecturing, and amateur theatricals. In his midteens he heard George Jacob HOLYOAKE lecture, went to London, met Charles SOUTHWELL and Robert Cooper, became a secularist, and brought his older brother, John WATTS, into the movement. John became its printer, first under the imprint of Holyoake at a Fleet Street House "collective" and then under that of Austin HOLYOAKE, Holyoake's younger brother, at Bradlaugh's *NATIONAL REFORMER*. In 1864 Charles joined as assistant printer and subeditor.

When the NATIONAL SECULAR SOCIETY (NSS) was formed in 1866, Watts became its secretary. At the 1868 parliamentary election he spoke on Bradlaugh's Northampton platform. Favoring the concept of a substitute church within the society, Watts established a secular Sunday school, devised a ceremony for the naming of infants (1868), and with Austin Holyoake wrote the *Secularist's Manual of Songs and Ceremonies* (1871). In 1872 a Hall of Science Club and Institute was formed to stage intimate musical and dramatic evenings free from "the blackguardism of a London music hall." Watts and his second wife, Kate Eunice WATTS, daughter of leading Nottingham freethinkers, were prominent performers.

Meanwhile, in a flurry of Republicanism, Watts became vice president of the London Republican Club in 1871 and in 1872 was nominated for the council of the National Republican Brotherhood, which the secularists soon repudiated. In 1874, while Bradlaugh was lecturing in America, Watts spoke on his behalf in Northampton. He supported Bradlaugh again in connection with an 1874 by-election. In that year Austin Holyoake died; Bradlaugh raised 650 pounds to purchase Austin's printing and publishing business, which Bradlaugh handed over to Watts—privately admitting that he trusted the business sense of Kate rather than Charles. At the same time Annie BESANT joined the NSS, became a *Reformer* contributor at a guinea a week—the same pay Watts was getting as subeditor—and wrote a new *Secular Song and Hymn Book* (1875), eclipsing Watts's earlier work in this genre. But Watts, not Besant, edited the paper during another American lecture tour by Bradlaugh. Also demoted in the secularist hierarchy in consequence of Besant's advent was George W. FOOTE. At the 1876 NSS conference Watts resigned his secretaryship to concentrate on lecturing, debating, and writing, including *The History of Freethought* (1877), part 3 of *The Freethinker's Text-Book.*

In 1877 Watts was prosecuted for publishing Charles KNOWLTON's contraceptive manual *Fruits of Philosophy* (1832). He pleaded "in point of law guilty" and incurred twenty-five pounds in costs. Having expected Watts to mount a defense instead of offering a guilty plea, Bradlaugh dismissed Watts as *Reformer* subeditor and cancelled his printing and publishing engagement. Watts struggled until he printed for William Stewart ROSS, resigned from the NSS, bought Holyoake's *Secular Review*, merged it with Foote's *Secularist*, and with them formed the British Secular Union. When that organization collapsed in 1884, Watts went to Canada as a lecturer of the Toronto Secular Society and founded *Secular Thought* (1885–1911). On Bradlaugh's death in 1891, he returned to England, rejoined the NSS, and briefly led the Birmingham Secular Society. In 1899 he became a principal lecturer of the RATIONALIST PRESS ASSOCIATION, which was run by his son Charles Albert, resigned again from the NSS in 1902 after quarreling with Foote, and died on February 16, 1906.

DAVID TRIBE

WATTS, CHARLES ALBERT (1858–1946), English publishing pioneer. Charles Albert Watts was born on May 27, 1858, the firstborn of Charles WATTS, one of the most important freethought leaders of the nineteenth century. His mother, Mary Ann Watts, died in 1870, aged thirty-one, when he was twelve. That same year, young Charles Albert Watts joined his father as an apprentice in their small printing and publishing business. Watts learned the trade from the bottom up, which gave him valuable insights for the future. An unassuming man, Watts built up Watts and Company to a position of strength not equaled by any freethought publishing house until the advent of Prometheus Books a century later.

Along with Watts and Company, Watts was instru-

mental in establishing several other important organizations and periodicals, some of which are still with us today, most conspicuously the RATIONALIST PRESS ASSOCIATION (RPA). In 1884 Watts established the *Agnostic Annual*, which in 1907 became the *RPA Annual*, and in 1927 the *Rationalist Annual*. This publication, which Watts edited until 1943, brought together some of the best writing from the previous year. The annual continued publication until 1980 and was a respected vehicle for humanist scholarship throughout its life. Watts's other important creation was the *Literary Guide*, which began in 1885 and served as a vehicle for promoting Watts and Company books; it went on to become one of the premier humanist journals in the world, today published as the *New Humanist*.

Watts's genius was in understanding how the publishing trade actually worked, and in being able to inspire confidence in men richer than himself to finance his innovative publishing ventures. The most daring of these was his plan to reprint substantial works of FREETHOUGHT, history, science, and BIBLICAL CRITICISM in paperback form for only sixpence or hardback for a shilling. These prices made such works accessible to working-class readers. Conventional wisdom was that poorer people lacked the inclination or ability to read works of this sort, but Watts proved them wrong. Between 1902 and 1912 Watts and Company produced the Cheap Reprints series, which made works by Thomas H. HUXLEY, Ernst HAECKEL, and others available to readers of modest means. Many titles in this series sold in the tens of thousands, often to the alarm of church leaders, who were incensed at the prospect of poor people having access to this sort of material. Eventually changes to copyright laws and pressure against railway vendors forced the Cheap Reprints series to come to an end. But in the meantime publishing history had been made. Watts repeated this success with the Thinker's Library, which ran from 1929 until 1951.

Things became more difficult for Watts after World War I, and even his skills weren't sufficient to prevent Watts and Company from suffering at the hands of aggressive new competition that imitated his earlier successes, in the form of the cheap Penguin paperbacks and rival popular-science series. Watts retired from active involvement in the RPA and Watts and Company in March 1930, though he retained the editorship of the *Rationalist Annual* until 1943 and of the *Literary Guide* until his death. He was succeeded by his hardworking and loyal son Frederick C. C. Watts. A surge of book buying during World War II masked Watts and Company's problems until after Watts's death on May 15, 1946. That Fred Watts failed to save the firm was through no lack of effort on his behalf. In 1954 the RPA took over direct ownership of Watts and Company, and in 1960 they sold the firm to Sir Isaac Pitman & Sons. The Rationalist Press Association and the *New Humanist* remain Charles Albert Watts's longest-lasting legacies.

BILL COOKE

WATTS, KATE EUNICE (1849–1924), English freethought pamphleteer and orator. "Kate Eunice" Watts, as she called herself and signed her publications, was registered as Eunice Kate Nowlan upon her birth, on February 8, 1849, and upon her marriage in 1870 to Charles (known as Charlie) WATTS. By the time of her death, she was registered as Kate Eunice.

She was the elder of two daughters of leading Nottingham freethinkers (see FREETHOUGHT), William and Eunice Nowlan, with whom Watts, the secularist printer, generally stayed during his lecture tours to the north of England; Kate grew up without ever having entered a church.

Charlie Watts's first wife, Mary Ann, died on April 6, 1870, aged thirty-one, and his two-year-old son, Wallace George, died less than two months later, leaving Watts with five surviving children aged between four and thirteen—the eldest son (aged twelve) being Charles Albert WATTS, who would later found the *Literary Guide* (now *New Humanist*), the *Rationalist Annual*, and the RATIONALIST PRESS ASSOCIATION (RPA). When Charlie married Kate on November 19, 1870, she must have come as, so to speak, a "godsend" to that doubly bereaved household.

Still young and pretty, she became the belle of the London freethought movement and a sort of hostess at the Hall of Science—though soon to be rivaled by the Charles BRADLAUGH protegée Annie BESANT. Kate's elocution, wit, and histrionic talent were much admired as she gave lectures, chaired meetings, and took part in social entertainments. She also wrote polemical essays for the *NATIONAL REFORMER* and later the *Secular Review*, sometimes reprinted as pamphlets.

She bore Charlie one daughter, Kate Eunice, in May 1875. Being a supporter of the neo-Malthusians (as family-planning advocates were then called), Kate probably thought this one addition to the family enough.

When Charles Watts broke with Bradlaugh and Besant over the *Fruits of Philosophy* controversy, Kate spoke and wrote in her husband's defense. The dispute arose when Watts, arraigned for trial in 1877 as the printer of that allegedly obscene booklet advocating birth control (written in the 1830s by the American doctor Charles

KNOWLTON), changed his original plea of "Not Guilty" to "Guilty in Law." He did this because Kate, having actually read the booklet, decided that the style of writing was too coarse to be defended—certainly if it were to result in several years' imprisonment at hard labor for her husband. The Bradlaugh faction saw this withdrawal as a cowardly betrayal and cancelled its contract with Watts to print the *National Reformer* and other secularist work—a serious financial blow.

Watts then acquired the *Secular Review* from George Jacob HOLYOAKE, including in it a series of three feminist articles on women's education and social status by Kate. However, it was a struggle to carry on. So, handing over the printing business to son Charles Albert—who had been working in it from the age of twelve—Charles and Kate left Britain in 1886 for Toronto to work on behalf of SECULARISM. They continued their lecturing and writing in Canada and founded the important Canadian freethought journal *Secular Thought* (1887–1909).

In a ten-cent pamphlet, *Christianity Defective and Unnecessary*, Kate commented that the fact that the Garden of Eden serpent was male proved that "the greater amount of wickedness was even at that early stage possessed by those of the masculine gender, and they have firmly and undeniably maintained their right to its possession ever since."

The Wattses returned to London in 1891. Charlie joined George William FOOTE on the *Freethinker*, while Kate developed her career as an actress under her stage name of Kate Carlyon, appearing in eleven successful plays in London and the United States. These included Jerome K. Jerome's *The Passing of the Third Floor Back* (1908), with 180 London performances. Her final recorded role was that of Mrs. Gilbey in George Bernard SHAW's *Fanny's First Play* (1915).

After a short illness, Kate Eunice Watts died on February 25, 1924. She bequeathed to the RPA letters from US agnostic orator Robert Green INGERSOLL and a large oil portrait of him, inscribed by him to Charles Watts.

The funeral oration at Golders Green Crematorium was given by F. J. Gould, and Kate's ashes were buried in Highgate Cemetery beside those of Charles Watts and next to the grave of G. J. Holyoake.

BARBARA SMOKER AND VIRGINIA CLARK

WATTS, JOHN (1834–1866), English editor and writer. A good "all-arounder" and trusted lieutenant of Charles BRADLAUGH, he would be much better known were it not for his tragic early death.

John was born in Bedminster, Bristol, England, on October 2, 1834. He was the son of a cobbler and Wesleyan lay preacher and became a Sunday school teacher himself, but was converted to freethought by his younger brother, CHARLES. Following Charles to London, he learned the printing trade and from 1855 managed the printing agency at the Fleet Street House, a secularist "collective" directed by George Jacob HOLYOAKE. He also became subeditor of Holyoake's weekly *Reasoner* (1846–61). After Holyoake's younger brother, Austin, another printer and subeditor, entered the business, Watts was dismissed and threw in his lot with Bradlaugh, then coeditor of the *NATIONAL REFORMER*, in 1860, and became its subeditor. He also collaborated with Bradlaugh in a popular series of biographical sketches, *Half-hours with Freethinkers* (1858), and in radical political causes. In 1862 he was secretary of the Garibaldi Demonstration Committee, protesting against French occupation of Rome before Italian unification.

Bradlaugh, always struggling against poor health and increasingly involved in political and private financial affairs, handed over the *Reformer* editorship to Watts from March 7, 1863, to April 22, 1866. Though Watts wrote well here and in several pamphlets on religion and philosophy, he lacked Bradlaugh's unique capacity to identify newsworthy issues and attract outstanding contributors, and the paper's circulation declined. But what prompted Bradlaugh to resume the editorship was Watts's grave illness with tuberculosis. Nevertheless, Watts was one of four candidates for presidency of the NATIONAL SECULAR SOCIETY in September 1866. He died on October 31 of that year.

DAVID TRIBE

WEINBERG, CHAIM LEIB (1861–1939). Born in Ciechanowiec in the Russian Empire (now Poland), Chaim Leb Weinberg was part of a family of well-to-do landowners who intended him to become a rabbi. Instead he emigrated to London, where he heard an atheistic speech by Charles BRADLAUGH. Finally, at age twenty-one, he arrived in the United States, where he worked rolling cigarettes, first in New York and then briefly in Durham, North Carolina, where sometime around 1884 he first discovered his oratorical talents during a union organizing drive.

From this period he became a follower of the Russian anarchist and atheist Johann Most, and for the rest of his life, Weinberg preached revolutionary anarchist-communism, always paired with intense atheism (see ANARCHISM AND UNBELIEF). In Philadelphia he was a member of the Knights of Liberty, which sponsored an elaborate and very public Yom Kippur Ball in 1889, enraging pious Jews. In 1891 the event was prevented by a police raid, which resulted in four men serving eight-month jail terms. His major activity was to give public orations in Yiddish on atheism, anarchism, and the labor struggle. Weinberg inspired striking Jewish workers with fiery speeches during countless strikes from 1889 through World War I, sometimes as a paid organizer for a bakers' and then a garment workers' union. Though he never put pen to paper, his skills as a storyteller, comic, and debater were legendary. Remembered as conspicuously ugly, sloppily dressed, and badly lame, he was sometimes laughed at as he approached the podium, only to hold the audience spellbound when he opened his mouth. Weinberg toured the United States, Canada, and England during his career, and was a stalwart of the anarchist movement at Philadelphia, especially forming cooperative businesses and communities. In 1900 he initiated the Jewish Workers' Cooperative Association, which had some nine hundred members and two retail stores at its peak. Arrested in 1908 for inciting a riot between police and unemployed workers, he was later acquitted. In old age he lived on a small farm in Willow Grove, Pennsylvania, where his memoirs were recorded in the form of oral testimony by Marcus Graham in 1930, and where fundraiser picnics were held to benefit anarchist projects. He died of heart disease.

ROBERT P. HELMS

WELLS, HERBERT GEORGE (1866–1946), English author and reformer. Although H. G. Wells was neither a deep nor a systematic thinker, his career-long humanist-socialist effort to challenge and revise orthodox religious beliefs received considerable attention. By age twenty-two, he spoke of religion as a collapsible cardboard structure that only a foolish child would depend on for support. Curious about religion's wide appeal, Wells read Christian writings including the Pauline epistles. His response ranged from an imagined future without anthropomorphic theology and religious denominations in *A Modern Utopia* (1905) to a vitriolic attack on the "evil institution" of Roman Catholicism in *Crux Ansata* (1943). Influenced by Fabian Society socialism and Darwinian biology, he channeled his own vestigial religious sentiment into societal programs designed to improve the human condition. He would become an honorary member of the RATIONALIST PRESS ASSOCIATION.

Evolutionary chance was a fact for Wells, but in the tradition of Ralph Waldo EMERSON and other Transcendentalists he also elevated the role of human will in responding to accident. In what he termed a confession of faith in *First and Last Things* (1908), Wells referred to this will as a Collective Mind. In a way reminiscent of Romantic pantheism, this Collective Mind emerges from and operates throughout human experience. In Hegelian fashion, this power destines humanity to increasingly evolved states of scientific advancement, rational insight, and social harmony.

Shocked by the horrors of World War I, Wells briefly reconfigured the Collective Mind in *God the Invisible King* (1917), a highly controversial publication he would eventually regret because it clouded rather than clarified his essentially positivist position concerning human destiny. This book seemed to acknowledge a supreme deity. In a risky maneuver designed to give hope during the war, Wells sought to accommodate popular belief in a higher being while also reiterating his notion of God as the Collective Mind or Mind of the Race. Again considering the allure of religion, especially during dark times, he affirmed that humanity's survival must be the biological purpose behind religious belief.

In Wells's followup novel, *The Soul of a Bishop* (1917), God again confusingly seems to be outside yet also within human experience. The protagonist rejects Christianity, espouses universal brotherhood, and

preaches a heaven only on earth. The book concludes: "Faith is a sort of *tour de force*. A feat of the imagination. For such things as we are. Naturally." Emphasized here is the thorough grounding of faith in humanity's physical nature and limited mind (imagination). For Wells, faith is biological, not supernatural, in origin. A feature of our survival instinct, it serves the "Mind of the Race" that propels humanity toward ever-greater achievements in the material world.

After the war, Wells continued to recast revealed religion. Revising the biblical account of Job, *The Undying Fire* (1919) suggests that God is actually the collective human spirit struggling toward "the unity and release and triumph of mankind." In such books Wells meant to tap into the appeal of biblical stories, which he acknowledged in *The Salvaging of Civilization* (1921) to be fictional but nonetheless powerful in conveying humanity's dramatic relationship to the scheme of things. His *Outline of History* (1920), apparently a reworking of an unacknowledged manuscript by Florence Deeks, offered a new Bible-like story—a sweeping narrative of the human spirit undergoing conversion-like awakenings as it breaks free from one framework after another in the course of its steady evolution toward a rational collective consciousness on earth. This human-derived force is what people really mean by God, Wells explained in *Experiment in Autobiography* (1934); it is the spirit of human wills uniting to "master our world and release its imprisoned promise."

WILLIAM J. SCHEICK

WESTBROOK, RICHARD BRODHEAD (1820–1899), American freethinker and educator. Born in Pike County, Pennsylvania, the son of a congressman, he was educated in common schools and became a traveling teacher. He earned a doctorate in divinity and was ordained in 1844 as a Methodist Episcopal minister. He switched to Presbyterianism in 1852 and served as secretary of missions for the American Sunday School Union between 1854 and 1861, establishing thousands of rural schools. He left the ministry and took an LL.D. at New York University, practicing law from 1863 to 1869, when he became a counselor in the US Supreme Court. During the 1870s he abandoned the law to invest in coal lands in western Pennsylvania, which he sold in 1882, retiring with considerable wealth to Philadelphia. An active member for many years in the Universal Peace Union, in 1884 he led the opposition to surrounding Philadelphia's City Hall with military statues, saying that they were better suited to cemeteries or prisons. The same year he became director of the Wagner Free Institute of Science, where he made a secular education and library available to the adult public, involved many leading scientists, and commissioned research expeditions. Westbrook served as president of the AMERICAN SECULAR UNION between 1888 and 1891. He authored five books and at least seven pamphlets, most of which were devoted to debunking the Bible and exposing church interference in education and marriage. Westbrook's active SECULARISM coincided with the death of his wife, Sarah Hall, in 1882. His second wife was Henrietta Payne, a physician and freethinker with whom he was an active member and lecturer of the Ladies' Liberal League from 1892. From 1888 he led a public campaign to enforce the secularist terms of Stephen Girard's will, which had established Girard College to educate orphan boys. The trustees of that institution had introduced religion into the curriculum. Westbrook died at his summer home in Rhode Island. He was remembered both for his religious and for his anticlerical periods, but always with warmth and respect.

ROBERT P. HELMS

WETTSTEIN, OTTO (1838–?), American freethought writer and lecturer. Otto Wettsetin was born April 7, 1838, in Prussia. His father, Theodore Wettstein, moved to Milwaukee,Wisconsin, in 1848. At age twelve Otto was sent to Chicago by his father to learn the jeweler's trade. From his mother's influence he became a Lutheran during this time. In 1857 he moved to Rochelle, Illinois, where he began business with a kit of tools, a trunk full of books, and four dollars. Later a friend gave him a copy of the freethought paper the *Boston Investigator*, which sparked his interest in science and poetry.

Through further studies Wettstein became a convinced materialist (see Materialism, Philosophical). He began to express his views in articles published in the Rochelle and Chicago papers, which resulted in Christians boycotting his business. He countered by turning to the freethought community for patronage. He ran ads in many freethought journals advertising his "Wettstein Watches," for which he became famous.

In 1882 Wettstein began writing for the leading freethought paper in the nation, *The Truth Seeker*. In 1885 he designed and introduced his famous freethought badge, which represented the evolution of the world from the darkness of superstition to the light of reason and science. It came to serve as the de facto emblem of the nineteenth-century American freethought movement. Among Wettstein's later designs was the Robert Green Ingersoll silver spoon, much prized by later collectors, and other trinkets.

His brother Herman was also a freethought writer. In 1897 Wettstein was elected treasurer of the American Secular Union, a major national freethought organization, and in 1908 was unanimously elected president of a group called the Materialist Association at its convention in Canal Dover, Ohio. Here he gave the address for which he would be best remembered, "The Ax to the Root, or a God Impossible in Nature."

Among the many articles he wrote for *The Truth Seeker* are "The Vagaries of Spiritism" (1890), "Is Theology Progressive?" (1886), "The Giant Delusion" (1893), "Which First, Mind or Matter?" (1883), and "What Caused a 'First Cause' to Create the Universe Six Thousand, but Not Six Quadrillion Years Ago?" (1888).

The date, place, and circumstances of Wettstein's death are unknown, but he had survived to age seventy when a short biography of him appeared in the freethought paper the *Blue Grass Blade* in 1908.

Michael Adcock

WHEELER, JOSEPH MAZZINI (1850–1898), English freethinker, editor, and scholar. Joseph Mazzini Wheeler was born in London of a radical father (hence the Mazzini, a tribute to Italian democratic reformer Giuseppe Mazzini). As a young man he spent time in Edinburgh as a lithographer. He met G. W. Foote in 1868 and they became lifelong friends. When Foote started the *Freethinker* in 1881, Wheeler became the subeditor, which he remained, apart from absences due to mental illness, until his death.

On Foote's imprisonment for blasphemy in 1883, Wheeler became editor, but his oversensitive and manic behavior led to a breakdown at a period when he felt deeply for the suffering of Foote. He recovered, but instability dogged him until he died in an asylum in 1898. He himself contributed to the journal's forcefully anti-Christian material with a hilarious "Trial for Blasphemy" (1882) in which Matthew, Mark, Luke, and John appear before a Court of Common Sense accused of vilifying Almighty God.

He wrote numerous articles for the freethought press and a number of books, his considerable scholarship being bolstered by hours spent in the British Museum Reading Room. His greatest achievement was *A Biographical Dictionary of Freethinkers of All Ages* (1889), which comprehensively detailed figures across centuries and nations. His aim was to show "how many of the world's worthiest men and women have been Freethinkers."

Two other books were *Bible Studies and Phallic Worship* (1892) and *Footsteps of the Past* (1895). He was particularly interested in the anthropological approach, being an admirer of James Frazer. He produced in collaboration with G. W. Foote *Crimes of Christianity* (1885) and a pamphlet on Voltaire (1894), one of many pamphlets he produced. Together with Foote he translated *Sepher Toldoth Jeschu* as *The Jewish Life of Christ*. His failure to complete a *History of Freethought in England* was a great loss, though some valuable parts remain.

Wheeler favored general secular education, to be paid for by disestablishment of the churches. His gentleness and sensitivity and his painstaking and accurate scholarship were admired by all, especially Foote, who said he was "true to others and true to himself." Even a member of the Christian Evidence Society sent a letter of condolence on his death.

JIM HERRICK

WHITE, ANDREW DICKSON (1832–1918), American educational reformer, diplomat, and Christian liberal. Andrew Dickson White did more than any other American to impress upon late nineteenth- and twentieth-century thought the idea that science and religion are bitter enemies (see RELIGION IN CONFLICT WITH SCIENCE; EVOLUTION AND UNBELIEF)—though that was never his intent.

Early Life. Born into a wealthy Episcopalian family on November 7, 1832, at Homer, New York, White received a sound primary education and showed a flair for scholarship. In 1849 he entered Geneva (now Hobart) College, a small Episcopal academy selected by his father. Conditions were dismal, the curriculum irrelevant, the teaching pedantic, his classmates intolerably unruly—or so it seemed to young Andrew, who prevailed upon his father to enroll him in Yale the next year. Even Yale fell short of his hopes; after graduating in 1853 he undertook three years of work and study in Europe. Impressed by the University of Berlin, he dreamed of creating a "true university" along German lines in the United States.

At some point in his education White broke with orthodoxy. This process began when he recognized the dissimilarities between the genealogies of Jesus in the Gospels of Matthew and Luke. Influenced by the liberal Congregationalist minister Theodore Parker and Unitarian William Ellery Channing (see UNITARIANISM TO 1961), White settled into a poised DEISM that rejected belief in miracles and eternal punishment. Yet White always called himself a Christian, never embracing ATHEISM, AGNOSTICISM, or FREETHOUGHT. "I have never had any tendency to scoffing," he later wrote. This capacity to embrace radical and traditional positions simultaneously without regard for their mutual contradiction would prove characteristic.

Returning to America, White joined the newly formed University of Michigan. He won repute as a lecturer in history and an abolitionist, bringing Frederick DOUGLASS to speak at Ann Arbor. During the Civil War White undertook an informal diplomatic mission to bolster British support for the Union cause. Afterward he returned to New York and won election to the state senate. There he met fellow senator Ezra Cornell, who had made a fortune wiring the nation for telegraphy.

A Shared Vision. New York was pondering how to manage its windfall under the Morrill Act of 1862, which gave states tracts of western land the proceeds of whose sale must fund higher education. White and Cornell found they entertained compatible visions for New York's land-grant university. In Cornell's words, it would be "an institution where any person can find instruction in any study," from scientific and technical subjects to the humanities. More controversially, it would be nonsectarian. Both men's experiences had fostered antipathy toward denominationalism: Cornell had been ejected from the Society of Friends for marrying a non-Quaker, while White had his distasteful memories of Geneva College. Cornell having pledged land at Ithaca, New York, and a portion of his large fortune—and White having pledged a portion of his own more modest fortune—additional to land-grant proceeds, the two achieved control over the project. After political controversy, Cornell University was chartered in 1865. White would be its first president.

Cornell would be the first American university of stature unaffiliated with a religious body. Sectarian papers libeled it as a den of infidelity and perversity, accusing "indifferentism" (insufficient attention to fine points of doctrine) or outright godlessness. So wounding was this criticism that in October 1868, Governor Reuben E. Fenton made a last-minute decision to boycott Cornell's opening ceremonies, even though he had already journeyed to Ithaca for the sole purpose of attending them.

Retaliation. Frustrated, White fired back. On December 18, 1869, he delivered a pugnacious lecture indicting religion as the greatest enemy of scientific discovery. Widely reprinted, the lecture was soon expanded into a series of articles in *Popular Science Monthly.* (That journal's editor, Edward Livingston Youmans, would soon solicit historian John William DRAPER to write *A History of the Conflict between Science and Religion*, which in 1874 popularized the "military metaphor" of science and religion as adversaries.) In 1876 White published a small book based on his lecture. He had sharpened its focus, now indicting "ecclesiasticism" rather than religion as the chief impediment to scientific discovery. Nor was science the only victim: "Both Religion and Science have suffered fearfully from unlimited clerical sway," he wrote, "but of the two, Religion has suffered most."

Cornell University thrived despite controversy. Among other things it was the first US university to institute coeducational study, erect a nondenominational chapel, or offer a degree in electrical engineering. Pastors across America discouraged young people from enrolling, though with little effect on admissions. White erected a mansion on campus in which his family resided from 1874 (see MONUMENTS TO UNBELIEF). He frequently attended Unitarian services in Ithaca.

Despite his reform rhetoric, White never ceased to emphasize Cornell's embrace of generic Christianity,

and on several occasions conceded to sectarian pressure. For example, having courageously recruited a Jewish instructor—ETHICAL CULTURE founder Felix ADLER—White stood by when conservative trustees forced Adler's dismissal following a controversial lecture on Christianity's intellectual debt to Judaism.

White held various diplomatic posts during and after his presidency of Cornell. As US minister to Germany he participated in establishing the international tribunal at The Hague. On an 1878 transatlantic voyage, White met agnostic orator Robert Green INGERSOLL; they talked about art. (White and Ingersoll would also share a posthumous maritime connection, both having their names attached to US "Liberty Ships" during World War II.) White continued to develop his ideas on science and religion.

White's *History*. Posted to Saint Petersburg as US minister to Russia in 1892–93, White began to assemble his magnum opus, a two-volume work published in 1896 as *A History of the Warfare of Science with Theology in Christendom.* In correspondence he wrote that he intended the work to stake out a position between "such gush as [Catholic apologist John Henry] Newman's on one side and such scoffing as Ingersoll's on the other."

As before, White distinguished between religion, which he reduced to the pure love of God and one's neighbor, and theology, which used the Bible as though a scientific text to make unprovable claims about the cosmos. White wrote to defend religion, "to keep the faith . . . in a Power in the universe good enough to make truth-seeking wise and strong enough to make truth-telling effective." He warned "against basing religious systems on miraculous claims which are constantly becoming more and more discredited and therefore more and more dangerous to any system which persists in using them."

Given White's intent, his method was curious. He wrote that "theological views of science" have "forced mankind away from the truth, and have caused Christendom to stumble for centuries into abysses of error and sorrow." Commitment to free inquiry made a scientist, he argued, dogmatism a theologian. This standard was not without problems: in different passages White placed Saint Augustine in both camps. White described how the medieval church's condemnation of usury had hobbled economic development. He offered a romanticized account of Galileo GALILEI's travails at the hands of the church. A similar treatment was accorded Copernicus. Where Draper's *History of the Conflict between Science and Religion* had been anti-Catholic in tone, White profiled Protestant failures as well, including belief in witches, the construal of earthquakes and comets as divine portents, and resistance to vaccination. White concluded that Christian theology had "arrested the normal development of the physical sciences for over fifteen hundred years"; moreover, beliefs concerning eternal punishment had emboldened European states to engage in increasingly brazen tortures and inhumane punishments.

The World Reacts. Though Draper's earlier volume outsold it, White's *History of the Warfare of Science with Theology in Christendom* enjoyed commercial success, including numerous printings over twenty-five years and translation into four languages. Its impact on scholarly and popular thinking regarding science and religion was greater still.

White was broadly misunderstood. A few clerics who grasped his intentions praised the book. But most who lauded it—among them Alexander Graham Bell, Lord Acton, and Andrew Carnegie—agreed with critics that the work constituted a devastating blow against Christianity. Freethinkers embraced it; atheist booksellers added it to their lists. Even Ingersoll wrote White a letter of praise, though he chided White for his deism, quipping: "The only power in the universe strong enough to make truth-seeking safe is man." Ultimately White's gift for incongruity undid him; most readers registered his surface radicalism yet failed to recognize the more traditional viewpoint hidden beneath the florid prose.

White continued in public life. In 1905 he published a two-volume autobiography, partly devoted to explaining once more what he had meant his *History* to achieve. In later years he worked for German-American friendship and other peace causes. He died on November 4, 1918, a week before the Armistice ended World War I. He was interred in Cornell's nondenominational chapel.

Writing in 1971, historian Paul Carter declared that White's *A History of the Warfare of Science with Theology in Christendom* did as much as any published work "toward routing orthodoxy in the name of science." *Rocks of Ages* (1999), zoologist Stephen Jay GOULD's eccentric plea for harmony between science and religion, made the same point. Insofar as science and religion came widely to be viewed as enemies, with science holding the moral high ground—and insofar as that conviction contributed to the growth of RATIONALISM, NATURALISM, and SECULARISM across the West during the twentieth century—Andrew Dickson White stands, however inadvertently, as one of the most effective and influential advocates for unbelief.

TOM FLYNN

WHITMAN, WALT (1819–1892), American poet. Walt Whitman's *Leaves of Grass*, which went through nine editions, each containing new material, was an epochal volume. It gave legitimacy to free verse, enlarged the thematic domain of poetry, and signaled the arrival of an indigenous American poetry.

Science and Poetry. In 1855, when the first edition of *Leaves of Grass* was published, the Romantic aversion to science still chafed poetic sensibilities. Through its invasive procedures, the standard indictment read, science violated nature's pristine wholeness, disfiguring the beauty of natural forms. With its voracious appetite for analysis, it eviscerated myth, wonder, spontaneity, reverie, and awe. Whitman dismissed the charges: "Hurrah for positive science. Long live exact demonstration!" *Leaves of Grass* bristles with allusions to meteorology, conservation of energy, stellar life cycles, evolution, and other matters of science.

Science and the Church. When *The Origin of Species* became a cause célèbre, Whitman plumped for Darwinism (see DARWINISM AND UNBELIEF), desirable "as a counterpoise to widely prevailing and unspeakably tenacious, enfeebling superstitions." These superstitions were purveyed by ecclesiastical institutions for which the poet had little respect. From his father, an admirer of Thomas PAINE, Whitman had imbibed anticlerical sentiments (see ANTICLERICALISM). He scoffed at the disparate creeds of religion, each claiming to see the truth through the colored lenses of its own dogmatism. Though hardly an agnostic (see AGNOSTICISM), Whitman liked the brash way Robert Green INGERSOLL and Thomas Henry HUXLEY twitted the religious establishment: "It does seem," he remarked, "as if Ingersoll and Huxley without any others could unhorse the whole Christian giant." Whitman believed science could clear the way for spiritual regeneration by softening hidebound creeds, fables, and traditions.

Science and Mysticism. While science was a useful antidote to superstition, it could not penetrate the spiritual substratum of reality. Hence, Whitman relegated science to the role of data collector for a higher muse. Scientific facts had esoteric ramifications best elucidated by sages, seers, and poets. Properly illuminated, the lore of science corroborated Whitman's eclectic mysticism, a mishmash of moral and epistemological tenets derived directly or indirectly from Platonic and Kantian idealism, Eastern mysticism, Quakerism (his mother was a Quaker), and American transcendentalism.

Like Ralph Waldo EMERSON, his proximate mentor, Whitman regarded material phenomena as cryptic symbols for spiritual truths: "The kernel of every object that can be seen, felt, or thought of has its relations to the soul, and is significant of something there." Everywhere Whitman turned, he found "letters from God" waiting to be deciphered. Decoded by the intuition, the letters revealed a suprasensible realm infused with forces, purposes, designs, and patterns emancipated from the laws of causality, logic, and probability. Whitman announced that life is indestructible, death is illusory, God is in everything, love binds all, evil is good, truth must be intuited, and truth is ineffable.

Criticism. For the empirically minded reader, Whitman's mysticism poses insuperable barriers. Since he treats intuition as a higher mode of cognition than reason, logic, and science, his claims cannot be evaluated by his own criterion for truth. When reason must defer to feeling and desire, anything goes. Subjected to mundane analysis, Whitman's claims emerge as semantic vacuums. Their import is largely psychological, metaphorical, and emotional.

Whitman denied metaphysical clout to pessimism. He insisted on a universe suffused with love, goodness, joy, equality, and justice, not one governed by what Robert Frost called "design of darkness to appall." Notwithstanding his hurrahs for science, Whitman was imbued with a romantic mentality. Earnest feelings were an entree to cosmic truths. Like Pascal, he thought everyone has an innate truth detector, the heart, which knows more than the head. All hearts spoke a common tongue because they had been instructed by the same cosmic tutor. So what seemed true to Whitman must be true for everyone. Had his mind been of an analytical cast, his reading of Ingersoll and Huxley might have raised a suspicion that hearts are multilingual. Fortunately for Whitman and the world, poetic truth need not be literally true.

GARY SLOAN

WHITTICK, WILLIAM A. (1847–1897), English anarchist, economist, and poet. Born at Devizes in Wiltshire, England, William Whittick passed through his Christian

phase trying to save the souls of the poor at a Saint Giles Church (probably in London). He moved to the United States in 1868, first living in Newark, New Jersey, and finally settling in Philadelphia around 1890. By 1887 he declared himself an anarchist (see ANARCHISM AND UNBELIEF) and atheist, believing that "when God dies, Man shall live," since the deity was "the apotheosis of ignorance." His conception of free-love held that monogamous marriage has a "deplorable effect on the mind," and that government intervention in morals and sex relations bungled what people could regulate infinitely better themselves, and that it led to cruelty and debauchery (see SEX RADICALISM AND UNBELIEF). His theory that money should have an "invariable unit of value" was widely reviewed, and another economist, Arthur Kitson, was accused of having plagiarized it. He championed a system of mutual banking under which government would be unable to interfere in money matters, and where "the ideal dollar" would act only as an equivalent for complex exchange, with all commodities having monetary capacity. He opposed the tariff on moral and economic grounds, closing one essay with the slogan "Free Trade is Anarchy!"

Not confining himself to theory, Whittick attacked injustices like unprovoked police violence and censorship, writing on contemporary cases. Likewise his FREETHOUGHT did not alienate him completely from Christianity, but found him frequently eulogizing the "ideal Jesus," even defending Mormonism when it was under attack. He agreed with Henry Drummond that science and religion do not conflict (see RELIGION IN CONFLICT WITH SCIENCE). He would argue more contrary to his opponent than his beliefs took him, enjoying the intensity of debate. When he had hurt the feelings of an opponent, he would earnestly apologize. His poems and essays appeared in the *Alarm* (Chicago), *Twentieth Century* (New York), *Liberty* (Boston), the *Individualist* (Denver), *Justice* (Philadelphia), the *Conservator* (Philadelphia), and the *Firebrand* (Portland, Oregon). After dragging his very sick body to freethought meetings, Whittick died of cirrhosis of the kidneys on July 12, 1897, at his home, survived by his wife and son.

WICKSELL, KNUT (1851–1926). See **SWEDEN, UNBELIEF IN.**

WILLIAMS, ROGER (1603?–1683), colonial American church-state separation advocate. A colonial-era minister, Roger Williams founded Rhode Island after being forced to leave Massachusetts by Puritan authorities there. His 1644 book, *The Bloudy Tenet of Persecution, for Cause of Conscience*, took the bold stand that a union between church and state was blasphemous and dangerous.

Early Life. Williams is believed to have been born in England in 1603. Williams was among the Puritans who fled persecution and came to North America. In 1635 he was appointed pastor of the Puritan church in Salem, Massachusetts.

Oath Controversy. Williams grew angry over a policy of the Massachusetts General Court that required all males over the age of sixteen to swear an oath of allegiance ending in "so help me, God." Williams argued that forcing a person to swear a religious oath against his will was wrong, as it required that person "to take the name of God in vain."

On July 8, 1635, Williams was summoned before the General Court, warned that his views were "erroneous and very dangerous," and told to stop spreading them. He did the opposite, writing a series of letters to church officials complaining about his treatment. On October 9, the General Court found Williams guilty of spreading "diverse new & dangerous opinions" and ordered that he be expelled from the colony within six weeks. This deadline passed without incident, but upon learning that he was about to be forcibly deported to England, in January of 1636 he fled into the wilderness and lived among the Native Americans until spring. He purchased from them a plot of land and proclaimed a new settlement called Providence.

Growth of Providence. Providence became a haven for those fleeing the Puritans' oppressive theocracy. True to his principles, Williams allowed anyone who agreed to keep the peace to settle there, even Quakers, a sect Williams personally detested. By 1640 about forty families were living in Providence. The settlement's governing charter promised to "hold forth Liberty of Conscience."

From the safety of his settlement, Williams continued to argue with Puritan ministers. In one letter to John Cotton, Williams spoke of the need for a "hedge or wall of Separation between the Garden of the Church and the Wilderness of the world." The phrase is striking because of its similarity to Thomas Jefferson's famous metaphor of a "wall of separation between church and state," but there is no evidence that Jefferson knew of Williams's phrase.

In 1644 Williams penned *The Bloudy Tenet*. The book raises arguments for church-state separation that are still used today. Williams argued that government officials

are not competent judges of theology, asserted that state-compelled worship harmed religion, and insisted that "soul liberty"—his term for religious freedom—was a gift from God, not the government.

Williams asserted that religious freedom was the birthright of everyone, "paganish, Jewish, Turkish, or anti-christian." He argued that the Christian church went astray when it accepted favored status from the Roman emperor Constantine the Great. He wrote in detail of the centuries of bloodshed sparked by Europe's religious wars.

In 1655 Williams wrote a famous letter appealing for religious toleration. He compared Rhode Island to a ship at sea. The voyage, Williams said, included "Papists and Protestants, Jews and Turks." The trip would go smoother, Williams insisted, if "none of the Papists, Protestants, Jews or Turks be forced to come to the Ship's Prayers or Worship; nor, secondly, compelled from their own particular Prayers or Worship, if they practice any." The commander of the ship, he wrote, like a government official, should stick to running the vessel and stay out of religious affairs.

Williams's Religious Views. Williams left the Puritan church in 1638 after deciding that he no longer believed in infant baptism. He became a Baptist but stayed with that faith less than a year. After that, Williams never formally joined another church. He came to believe that the true church would not be revealed until Jesus's second coming.

Williams died in 1683; the exact date is unknown. He was buried in a hillside near his home in Providence. The site is now a national park.

ROBERT BOSTON

WITCHCRAFT AND UNBELIEF. "Thou shalt not suffer a witch to live." This single sentence (Exod. 22:18) provided the ultimate theological justification for the trial and persecution of hundreds of thousands of witches in early modern Europe, extending from the twelfth to the eighteenth centuries. Belief in witches is, however, an immensely complex phenomenon, and the widely varying levels of witch hunting from one country to the next, and from one era to the next, can be explicated not only by varying religious doctrines but also differences in social, legal, and political conditions. Nevertheless, there is no reason to doubt Jeffrey Burton Russell's formulation that "European witchcraft is best considered a form of HERESY."

The ancient Hebrews appear to have regarded a "witch" as a seer, diviner, or necromancer—something on the order of the witch of En-dor, who purportedly raised the spirit of Samuel (1 Sam. 28:1–25). The ancient Romans conceived of witches who could harness supernatural powers for the purpose of causing harmful acts (*maleficia*), but they lacked any sense of the heretical nature of such acts, and therefore their pursuit of witches was sporadic at best. It was only in Christian times, when the notion of *maleficia* was fused with heresy (specifically the belief that witches made pacts with demons or with the devil himself to gain their powers), that the European witch hunt could gain traction.

The first known witch trial in Christendom occurred in 373 CE, but during the first several centuries of Christian political dominance of Europe (roughly, the fourth through the eighth centuries) more attention was given to organizing the church hierarchy, stamping out doctrinal heresies, and suppressing pagan (Greco-Roman) belief than to persecuting witches. It was, however, in the early medieval period that the chief powers of witches (casting spells to harm individuals, livestock, or crops; sexual orgies with demons or with other witches; cannibalism, specifically involving the killing and eating of infants; the ability to fly through the air) were gradually fashioned, derived from primitive folklore and the remaining vestiges of paganism. Surprisingly, religious authorities exhibited some skepticism regarding such powers. The *Canon Episcopi*—written by Regino of Prüm around 906 and serving as a foundation of canon law for the next five hundred years—condemned those who believed that witches ride through the air. Such a belief, Regino argued, would be heretical because it infringed upon the powers of God. But such skepticism decreased as the Middle Ages proceeded.

The power of Satan and demons was increasingly felt in the twelfth and thirteenth centuries, a result of rapid social changes and the emergence of several heretical cults that Christian leaders saw as threats to orthodoxy. The Catharists (who repudiated the world of matter as the creation of the devil) and the Waldensians (a group that practiced extreme asceticism) were ruthlessly persecuted, and many of their beliefs were misinterpreted and later applied to witches. Punishments against witchcraft became increasingly harsh from the eleventh to the thirteenth centuries. Torture (first attested in a witch trial in 805) began to be widespread. The establishment of the Inquisition in the 1230s gave an added impetus to witch trials, although the belief of older historians that the Inquisition actually caused the later European witch hunt is plainly false. Not only did the Inquisition not hold all or even a majority of witch trials in Europe (episcopal and secular courts were also involved), but the Inquisition declined at the very time when the witch hunt

attained its highest levels, in the fifteenth through the seventeenth centuries.

By the fourteenth century, witchcraft definitively came to be regarded as the worst kind of Christian heresy, as it signified actual repudiation of God and affiliation with the devil. The next century saw a vast expansion of both witch trials and witch literature, as the notion of the pact with the devil (a belief of the intellectual elite) fused with the popular notion of *maleficia*. There will always be a debate as to whether any of those accused of witchcraft actually practiced it in some fashion. Probably a small minority did so, but the great majority were accused not because of any actual satanic activities but merely because they were female (women were thought to be morally and intellectually weaker than men, and therefore more susceptible to temptation by the devil), elderly, practitioners of herbal magic or midwifery, and otherwise vulnerable and marginal members of society. (Margaret A. Murray's belief, in *The Witch-Cult in Western Europe* [1921], that European witchcraft was a holdover of an ancient fertility cult, has been thoroughly refuted.)

It is no paradox that the witch hunt was most virulent at the time of the Renaissance. Witch belief was a product of the generally magical worldview of medieval Christianity, and the leading intellectuals of the Renaissance not only failed to challenge this view but themselves endorsed it, although their "high" magic (astrology, alchemy, and so on) was very different from the "low" magic (spells, potions, and the like) accepted by the common people. Moreover, even those Renaissance thinkers such as Desiderius ERASMUS and Michel de MONTAIGNE who doubted the reality of witchcraft failed to overthrow the widespread belief in the power of demons or of the devil, and so were incapable of uprooting witchcraft belief at its source.

Pope Innocent VIII's bull *Summis desiderantes* (1484) confirmed papal approval of the Inquisition's witch hunts. The work he commissioned, the *Malleus Maleficarum* (The Hammer of Witches, 1486) by Heinrich Kramer and Jakob Sprenger, was only the culmination of witch treatises in the fifteenth century. Relatively few voices were heard on the other side. One of them was Johann Weyer, who in *De Prestigiis Daemonum* (On the Prodigies of Demons, 1563) and *De Lamiis* (On Witches, 1582) maintained that women who believed themselves witches were merely deluded; but he attributed these delusions to the devil, thereby indirectly endorsing witch belief. Even more bold was Reginald Scot, whose *Discoverie of Witchcraft* (1584) was the first English treatise devoted to witchcraft—a skeptical and mocking account that attributes "spiritual manifestations" to "artful impostures or illusions due to mental disturbance in the observers." The book was ridiculed by James VI of Scotland (later James I of England), who wrote his *Demonologie* (1597) as an explicit attempt to refute Scot.

The Protestant Reformation of the sixteenth century both enhanced the witch hunt—by emphasizing a close and literal reading of the Bible (including the notorious passage in Exodus) and by stressing the ever-present power of the devil in human affairs—and ultimately led to its decline. The idea gradually arose among philosophers and theologians that the sovereignty of God made it impossible for witches to perform their *maleficia* in defiance of God's wishes. By the seventeenth century, as thinkers and public officials came to realize that many individuals were being unjustly accused of, and executed for, witchcraft—through confessions extorted by torture, accusations from suspect sources, and the excessive zeal of prosecutors—a backlash finally began. Francis Hutchinson, in *An Historical Essay concerning Witchcraft* (1718), delivered perhaps the final intellectual blow to witchcraft belief, excoriating the unfairness and viciousness of witchcraft trials. In addition, scientific and philosophical advances led to the notion that the universe worked in an orderly manner, thereby making the supernatural machinations of witches (and of the devil himself) implausible. From this point onward, both witch trials and intellectuals' belief in witchcraft became increasingly rare. The Salem witchcraft trials of 1692 were an aberration in the American colonies, but Cotton Mather did not distinguish himself by confirming belief in witches in *Wonders of the Invisible World* (1693). As late as 1760, John Wesley, the founder of Methodism, declared in his journal that disbelief in witchcraft meant disbelief in the Bible.

S. T. JOSHI

WITTGENSTEIN, LUDWIG (1889–1951), Austrian philosopher. Scion of one of the wealthiest families in Austria, Ludwig Wittgenstein came to England specifically to study with Bertrand RUSSELL, the best-known logician of the time. At first a protégé of Russell's, he later broke with him over the claim that mathematics can be firmly grounded in logic. The two for a time shared an interest in mysticism, but Russell seemed to ignore the underlying mystical nature of Wittgenstein's first book

(and the only one published in his lifetime), the *Tractatus Logico-Philosophicus* (1922), for which he wrote an introduction. Russell was not the only one so fooled. The so-called Vienna Circle movement (see SCHLICK, MORITZ, AND THE VIENNA CIRCLE) likewise interpreted Wittgenstein's work to be saying that all of nature could be reduced to propositions. "A proposition," he wrote, "is a picture of reality. A proposition is a model of reality as we think it to be." They interpreted this to mean that all metaphysical statements were, strictly speaking, nonsense, since they were nonpropositional. If a claim could not be expressed in terms that were verifiable, then such a claim should be ignored. Followers of this view became known as Logical Positivists (see LOGICAL POSITIVISM), and credited their origin to Wittgenstein's writings. A. J. AYER, one of the circle's most prominent members, used this verification argument (see VERIFICATIONISM) to show that all claims about God were meaningless, and could thus be ignored. After all, Wittgenstein himself had written: "The limits of my language means the limits of my world."

Wittgenstein, who had disappeared shortly after publishing the *Tractatus* (he felt he had solved all the problems of philosophy in this short work, and could move on to other pursuits such as teaching elementary school, designing buildings, and working as a gardener for a monastery), was horrified upon learning that his book was being used to justify a materialistic, even atheistic, philosophical movement. Just because you could not express a concept did not mean the concept itself was nonsensical, he objected. It could simply be ineffable. He therefore left his unworldly pursuits to return to philosophy, teaching for a time at Cambridge and repudiating much of what he had written. Russell was to say of him that he resembled Blaise Pascal, who had likewise abandoned mathematics for piety.

There was a distinctive mystical air around Wittgenstein, and many of his students treated him like a guru. He spent the remainder of his life pursuing the question of the role played by language in human affairs and the limitations it places on the expression of ideas. These observations were published posthumously as the *Philosophical Investigations* (1953). Later, several of his students' notebooks and other uncollected and miscellaneous writings were published as well, which would have infuriated a man so careful with his views that he agonized over every word.

The question of Wittgenstein's own religious beliefs remains, like so much else about him, a mystery. His paternal grandfather (the founder of the vast Wittgenstein fortune) was a convert from Judaism to Protestantism, a fact that did not protect the Wittgenstein family in Vienna when the Nazis came to power. Wittgenstein's brother Paul paid a huge sum of money to the Hitler regime to arrange for the safe escape of his sisters from Austria. Wittgenstein's mother was Roman Catholic, and he himself was baptized in that faith. He manifested a strong ascetic streak throughout his life, as well as a proneness toward depression. Three of his brothers committed suicide, and when Ludwig several times expressed the desire to end his life, his family took it seriously. Russell once remarked that, upon seeing Wittgenstein pacing the room in apparent agony, he jocularly asked, "Are you thinking about logic or your sins?" to which Wittgenstein replied, "Both."

While Wittgenstein seemed to have no conventional religious views and was considered an atheist by some, he often expressed great sympathy for religious figures, particularly those of a contemplative nature. Although he was always loath to admit any influence upon him from previous philosophers, he did admit a fondness for certain aspects of Saint Augustine's writings. It also seems clear that he was familiar with Arthur SCHOPENHAUER's *The World as Will and Representation*, and seemed to agree with that atheist's claim that human beings are metaphysical by nature.

Perhaps what most marked Wittgenstein was his often-professed desire to be perfect. This high—indeed impossible—standard had a major impact upon all who came to know him. His tormented nature, his unceasing search for truth, his inability to suffer fools gladly, and his apparent lack of humor all attest to a modern-day mystic. Surprisingly enough, given how unsatisfied he seemed with the mundane world around him, his last words, according to his friend Norman Malcolm, were: "Tell them I've had a wonderful life!"

TIMOTHY J. MADIGAN

WIXON, SUSAN H. (ca. late 1840s–1912), American freethought writer and feminist. The daughter of Bethia Smith Wixon and Captain James Wixon of Dennis, Massachusetts, Susan H. Wixon was "born a Liberal," according to FREETHOUGHT editor Samuel Porter PUTNAM. In an early contretemps with an orthodox Sunday school teacher, Wixon suggested that anyone who would make a lake of fire and brimstone in which to incinerate his children ought to be the first one burned in it.

At the top of her public school class, Wixon began teaching school at age thirteen, placing first in a teacher's examination. Her father denied her a college education, but Wixon attended a seminary for one year before continuing her career as a teacher in Massachusetts and Rhode Island.

A radical freethinker, Wixon was the first woman to lecture at Paine Hall in Boston. She represented Massachusetts and spoke at the 1890 convention of the Woman's National Liberal League founded by Matilda Joslyn GAGE. She was honored by a local newspaper for her "thrilling eloquence" in successfully arguing as a stockholder against corporate funding of sectarian activities.

Wixon persuaded the governor of Massachusetts to appoint women factory inspectors in 1891. She traveled abroad in 1892, collecting statistics for lectures on women's work and wages. Wixon was elected to the woman's industrial advancement committee in the inventor's department of the World's Columbian Exposition. She wrote prose and verse for the freethought press, serving as editor of "The Children's Corner" for *THE TRUTH SEEKER* for at least a decade. Wixon's *The Story Hour* (1885) was advertised as the only illustrated freethought storybook for children. Her books include *All in a Lifetime, Apples of God* (1876, short stories), *Sunday Observance; or, How to Spend Sunday* (1883), and *Summer Days at Onset* (1887).

Her lecture "Woman: Four Centuries of Progress," delivered at the Freethinkers' International Congress in Chicago, Illinois, in October 1893 and reprinted as a pamphlet by the Truth Seeker Company in December 1893, traced the fall of woman under Christianity, listed the tenets of the canon law degrading to women, and argued, "Freethought has always been the best friend woman had."

ANNIE LAURIE GAYLOR

WOLLSTONECRAFT, MARY (1759–1797), English deist and feminist. Mary Wollstonecraft is best known for her work *A Vindication of the Rights of Woman.* Written in 1792, it is considered the first book calling for equality of the sexes. Earlier she wrote *A Vindication of the Rights of Men* and was throughout her life an advocate of the rights of all human beings, including children. She was a DEIST and independent thinker.

Her father, Edward, was domineering and abusive. Wollstonecraft never forgot her mother's submissive attitude toward her husband and determined that women must be properly educated so as not to be dependent on the goodwill or whim of men. At age twenty-four, she and a friend established a day school. She also worked as a governess and wrote a pamphlet titled *Thoughts on the Education of Daughters.* The pamphlet was published by Joseph Johnson, who became her friend and benefactor.

When Wollstonecraft moved to London in 1787, Johnson welcomed her into his circle of friends. The circle included many of the influential thinkers of the time, including Thomas PAINE. Johnson gave Wollstonecraft work translating French and German books and writing short reviews for the *Analytical Review* which he published with Thomas Christie.

In 1790 Edmund Burke's *Reflections on the Revolution in France*, expressing his strong sentiments against the revolt, produced much dissent in the Johnson circle. In answer the *Analytical Review* carried "Replies to Mr. Burke." Wollstonecraft's *Vindication of the Rights of Men* was among the first to be published. In it, among other things, she bitterly attacked the institution of the Catholic Church. The piece, published anonymously, was a huge success. A second edition followed quickly, this time with her byline. Written in 1791, it was one of the earliest serious political polemics by a woman and made her known beyond the Johnson circle.

Less than two years later Wollstonecraft wrote *A Vindication of the Rights of Woman.* Here she clearly put forth her belief that the nature of humans, male or female, and their capability for happiness rested on reason, virtue, and knowledge. In it she wrote, "In fact it is a farce to call any being virtuous whose virtues do not result from the exercise of its own reason."

A Vindication of the Rights of Woman was also an elaboration on her earlier work on the education of women. Wollstonecaft advocated drastic changes in the education of boys as well as girls through a national system of free coeducational elementary schools. The curriculum she proposed for children aged five through nine included botany, mechanics, astronomy, reading, writing, arithmetic, and natural history. *A Vindication of the Rights of Woman* was a sensation. It made her famous, and in some circles infamous.

Wollstonecraft married the writer William GODWIN early in 1797. In September of that year she died of a massive infection following the birth of their child. She was thirty-eight years old. The baby, named Mary, is famous as the author of the novel *Frankenstein.*

LOIS PORTER

WOMAN SUFFRAGE MOVEMENT AND UNBELIEF. For much of US history, the elective franchise was

denied to its female citizens. The Constitution's separation of church and state notwithstanding, much of the argument against female suffrage was motivated by religious doctrine that seriously circumscribed the roles women were permitted to play in the public sphere. Therefore, those women who initially challenged the state's limitation of the elective franchise to (white) male voters were also directly confronting centuries-old religious tenets. Of all their demands, suffrage was initially the most radical. In time, however, suffrage would become the sole focus of the powerful evangelical branch of the women's movement, effectively marginalizing all other feminist demands and the freethinkers who espoused them.

Freethinking Foremothers. Christian belief based on an interpretation of the Pauline epistles forbade women from speaking publicly to mixed-sex audiences. The first American woman to break significantly with this tradition was Frances WRIGHT, a Scottish immigrant and humanist who began a lecture tour in 1828 in which she criticized religion and advocated women's education. To many, she was a model of courage. For most others in the highly charged Protestant atmosphere of the fledgling United States, she was simply monstrous. In 1836 another immigrant, the Polish atheist Ernestine L. ROSE, shocked American sensibilities when she drew up a petition for the Married Women's Property Act in New York, a bill that would not pass until 1848. In 1837 Sarah Grimke, who with her sister, Angelina, gave public lectures on abolition and women's rights, published *Letters on the Equality of the Sexes and the Condition of Woman.* The exclusively male clergy of the nation exploded in anger, decrying the women as unsexed and sinful. Women joined men in their disapproval of these freethinking women, believing that women did not need any more rights. That belief was about to change.

Zealots and Ultraists. Ironically, it was the religious enthusiasm that so characterized the first half of the nineteenth century that provided a nursery for the development of humanistic reform. Evangelical Protestantism, partaking of the Jacksonian spirit of individualism and enterprise, encouraged its adherents, male and female, toward the salvation of the world. As women became involved in activism, particularly on behalf of temperance and abolition, they became increasingly aware of their limitations both within the reform societies and within Christianity itself. Despite their tireless efforts and deep enthusiasm for reform work and regardless of their skill, they were not welcome in leadership positions and were relegated to segregated auxiliary groups.

Many women rebelled against these limitations by rejecting their churches' teaching of female inferiority, turning to alternative perspectives of less orthodox denominations such as the Universalists and the Unitarians. Many admired the Quaker belief in the equality of the sexes that had led that denomination to recognize women in the ministry. Others would reject Christianity altogether, choosing instead a nontheistic approach (see WOMEN AND UNBELIEF) as atheists, agnostics, humanists, spiritualists, and, later, Theosophists (see THEOSOPHY). These "ultraist" women, always a minority even among reform-minded women, embraced FREETHOUGHT as they challenged the very foundations of their society. As authors, lecturers, and agitators, they sacrificed propriety for the sake of a suffering humanity they believed only human agency could save. While history gives examples of individual women who made this assertion, never before did so many women join together with such undaunted persistence. Their actions on their own behalf would be revolutionary.

The Seneca Falls Convention. History recognizes 1848 as the year of revolutions. Margaret Fuller, freethinking editor of the Transcendentalist *Dial* and author of *Woman in the Nineteenth Century* (1845), was in Italy engaged in the Italian revolution in 1848. Because she died in a shipwreck off the shores of Fire Island two years later, the women's rights movement could not fully benefit from her feminist genius. But in the small upstate New York town of Seneca Falls another genius was engaged in her own revolutionary impulse, and she did not act alone. Elizabeth Cady STANTON was mentored and supported by Lucretia Mott, a Hicksite Quaker already well known as an accomplished public speaker and women's rights advocate. Joining Mott and Stanton were two liberal Quakers, Jane Hunt and Mary Ann M'Clintock. Together these women would organize the Seneca Falls convention at which they put forth the Declaration of Sentiments, a document following the language patterns and ideals of the Declaration of Independence. Relying on a republican theory of natural rights, among other things, they assailed the power of the church, called for equal access to colleges and the professions, for control of their property and children, and most shockingly, they demanded suffrage.

Lucretia Mott, whose mentorship was instrumental in formulating Stanton's growing religious heterodoxy, thought the younger woman's inclusion of the demand for the vote in the Declaration of Sentiments was unwise. It would never be accepted. Indeed, of all the resolutions, it was the only one that was very nearly rejected by the participants. Only the impassioned support of Frederick DOUGLASS convinced the participants to include it, and then only marginally. None of those present could have guessed that the call to suffrage would so soon become the focus for women's rights activism.

Spiritualism. Simultaneous with the birth of the organized women's rights movement in the United States was the advent of popular Spiritualism. Beginning with the activities of the Fox sisters in Hydesville, New York, a town only a short distance from Seneca Falls, the Spiritualist movement spread rapidly to all parts of the nation. Spiritualists were associated with freethought due to their disavowal of traditional religious claims in

favor of a more egalitarian, human-centered spirituality. A spirituality dominated by women who broke with the Christian prohibition against women preaching in public through mediumship and trance speaking on reform lecture circuits, Spiritualists had a strong tendency toward women's rights activism, typically populating its most liberal wing. In 1848, the Quaker women who formed the nucleus of support for the nascent women's rights movement were also directly involved in the newborn Spiritualist experimentation that would soon overwhelm the nation.

Antebellum Radicals. In the years leading up to the Civil War, the women leading the suffrage cause moved among the most radical thinkers of the nation. Those people associated with the demand for suffrage were also likely to support the immediate freedom of slaves, prison reform, dress and dietary reform, and rights for children, indigenous peoples, and laborers. They were more likely to experiment with alternative expressions of spirituality, most notably as Unitarians, Universalists, and Spiritualists, or to eschew religious sentiment altogether in favor of rationalism and science. They joined communes, spoke on lecture circuits, and everywhere challenged organized religion's admonition that women learn quietly from their husbands at home.

Of these freethinking women, Matilda Joslyn GAGE, Elizabeth Cady Stanton, Susan B. Anthony, and Lucy Stone became the most prominent in the movement. They operated amid the support and genius of a generation of reformers who challenged the status quo of a slaveholding, sexist, and class-stratified society. As suffrage leaders, they all recognized organized religion's primary role in silencing the oppressed and in circumscribing women's roles. Freethinkers denounced the Christian view of women as primarily sinful sexual creatures, designed since the days of Eve to serve men. Susan B. Anthony, reared a Quaker, was an agnostic, as was Lucy Stone, but Gage and Stanton were the most radical of the suffragist leadership. While the other women saw the need to publicly soften their freethought positions, Stanton and Gage grew increasingly more intolerant of what they understood to be the underlying religious foundation of sexism.

Postwar Schism. The suffrage movement was all but suspended during the years of the Civil War, although many suffrage leaders, particularly Stanton and Anthony, continued to publicly advocate universal suffrage. Suffragists believed their service to the Union cause during the war would be rewarded. They were bitterly disappointed when following the war, the constitutional amendment to enfranchise black men included, for the first time, the use of the word "male" to qualify citizenship in the United States. This issue drove a wedge between suffragists with many, most notably Lucy Stone, opting to belay emphasis on white woman suffrage in favor of the fight for the rights of freed blacks. Susan B. Anthony and Elizabeth Cady Stanton, enraged and impatient, even descended to racist rhetoric in their increasingly strident demand for women's enfranchisement.

But the split between the suffragists was about far more than racial politics. The two groups that formed in 1869 differed considerably in approach and theory. The National Woman Suffrage Association (NWSA), led primarily by Anthony, Gage, and Stanton, was the more liberal of the two. Focusing on the assumption that suffrage should be gained through federal acknowledgement of women's constitutional rights as citizens, its membership was more diverse, its platform broad enough to include a wide range of often dissenting theoretical and religious opinions. On the other hand, Lucy Stone's American Woman Suffrage Association (AWSA) adopted a strategy to achieve the vote state by state, and was a far more socially conservative organization appealing to white middle-class respectability.

Freethinkers Purged. Following the Civil War, an increasing number of women joined benevolent and reform societies. Unlike the radical reformers of the antebellum period, many of these women were religious conservatives who used their evangelical faith to expand their traditional roles as caregivers to social housekeeping in the public sphere. These participants in the social gospel were characterized by Frances Willard, leader of the Women's Christian Temperance Union (WCTU), who embraced the promise of suffrage to forward her agenda to promote Christian influence and morality into American life and politics.

While Stanton and Gage grew increasingly concerned with such controversial topics as matriarchal religion and the sexual exploitation of women and children, Susan B. Anthony became more singularly focused on suffrage as a panacea for all women's concerns. Despite the indignant opposition of Gage, Stanton, and their supporters, she and Lucy Stone orchestrated a merger between the more conservative AWSA and the NWSA in 1889 in an effort to pull in the support of socially conservative suffragists.

The growing dominance of religious fundamentalism in the newly formed National American Woman Suffrage Association (NAWSA) demanded the marginalization of freethinkers as dangerous to the respectability of the suffrage cause among Christian conservatives. Anna Howard Shaw and Carrie Chapman Catt disliked Stanton, fearing that her freethought positions would be dangerously unpopular with the Christian membership of the suffrage movement. After the publication of Stanton's *Woman's Bible* in 1895, the NAWSA passed a resolution disavowing any connection to it. Stanton had supporters in freethinkers Charlotte Perkins Stetson (GILMAN), Lillie Devereaux BLAKE, and Clara Colby. Additionally, the agnostic Susan B. Anthony temporarily turned from her evangelical allies to rally to her old friend's support. Nonetheless the resolution passed easily. Stanton, already discouraged by the narrow focus on suffrage at the expense of other women's rights con-

cerns, distanced herself from the movement, preferring to write and think independently.

Matilda Joslyn Gage fared no better than Stanton in her attempt to challenge the religious right wing. She left the increasingly conservative NAWSA and began the Women's National Liberal Union, an organization that attracted freethought suffragists, prison reformers, anarchists, socialists, and other freethinkers. This organization drew sharp criticism from Anthony, who was offended by Gage's uncompromising radicalism. Her monumental work, *Woman, Church, and State*, though widely acclaimed by freethinkers, was spurned by the suffragist organization. Gage, like many other feminist freethinkers, would be effectively expunged from suffrage history.

A Singular Focus. From the 1880s to the ratification of the Nineteenth Amendment in 1920, women's rights activists had a singular focus. Except in token numbers, their doors were closed to women who might offend powerful Christian suffragists. Black women and women of alternative spiritual or philosophical traditions were an embarrassment to a movement that courted the support of well-to-do Protestant evangelical women.

Susan B. Anthony and her successor, Carrie Chapman Catt, eventually won the vote with this focused, conservative approach, but at a significant cost. With the elimination of diversity and serious theoretical women's rights scholarship from the suffrage movement, women were left with a mere shell of the thriving intellectual tradition they had begun in the early nineteenth century. As freethinkers, they had challenged not only their limitations as citizens, but had called into question the very religious foundation of bigotry in the United States. It would take several decades for women to reclaim their earlier work to liberate women from their multiple and complex bonds of sexual, familial, economic, and religious degradation. In their rejection of the freethinkers' leadership, evangelical Christian suffragists and their supporters declared that the vote alone would solve "the woman question." Following ratification of the Nineteenth Amendment, women remained oppressed by an increasingly muscular Christianity that continues to undermine full sexual equality. The vote was not enough.

WOMEN AND ISLAM. It cannot be denied that Islam is deeply, irreparably antiwoman. Islam stands as the fundamental cause of the repression of Muslim women, and it remains the major obstacle to the evolution of their position in Islamic societies. Islam has always considered women as creatures inferior in every way—physically, intellectually, and morally. This negative vision is divinely sanctioned in the Qur'an, corroborated by the hadiths, and perpetuated by the commentaries of the theologians (see ISLAM, UNBELIEF IN).

In the Beginning. Islam took the legend of Adam and Eve from the Old Testament and adapted it in its own fashion. The creation of humankind from one person is mentioned in the following suras (Qur'anic verses):

> IV.1. O Mankind! Be careful of your duty to your Lord who created you from a single soul and from it created its mate and from them twain hath spread abroad a multiple of men and women.
>
> XXXIX.6. He created you from one being, then from that (being) He made its mate.
>
> VII.189. He it is who did create you from a single soul and therefrom did make his mate that he might take rest in her.

From these slender sources, Muslim theologians have concluded that man was the original creation—womankind was created secondarily for the pleasure and repose of man. The legend was further developed to reinforce the supposed inferiority of women.

In the Qur'an as in Genesis, God punishes Adam and Eve for disobeying his orders. But there is nothing in the Qur'anic verses to illustrate, as Genesis does, that it was Eve who led Adam astray. At this level Islam appears to offers more meager fuel for misogyny. Yet Muslim exegetes and jurists have created, as though from whole cloth, a myth of Eve the temptress that has become an integral part of Muslim tradition. Muhammad himself is reputed to have said: "If it had not been for Eve, no woman would have been unfaithful to her husband."

Berating the Goddesses. In attacking the female deities of the polytheists, the Qur'an maligns the female sex yet further.

> IV.117. They invoke in His stead only females; they pray to none else than Satan, a rebel.
>
> LIII.21–22. Are yours the males and His the females? That indeed were an unfair division!

> LIII.27. Lo! it is those who disbelieve in the Hereafter who name the angels with the names of females.

Other Qur'anic verses also reflect misogyny:

> II.282. But if he who oweth the debt is of low understanding, or weak or unable himself to dictate, then let the guardian of his interests dictate in (terms of) equity. And call to witness, from among your men, two witnesses. And if two men be not (at hand) then a man and two women, of such as ye approve as witnesses, so that if the one erreth (through forgetfulness) the other will remember.

> IV.11. Allah chargeth you concerning (the provision for) your children: to the male the equivalent of the portion of two females.

> IV.34. Men are in charge of women, because Allah hath made the one of them to excel the other, and because they spend of their property (for the support of women). So good women are the obedient, guarding in secret that which Allah hath guarded. As for those from whom ye fear rebellion, admonish them and banish them to beds apart; and scourge (beat) them. Then if they obey you, seek not a way against them Lo! Allah is ever High Exalted, Great.

Equally, in many of the hadiths upon which Islamic law is based, we learn that the woman's role is to stay at home, to be at the beck and call of man, to obey him (as a religious duty), and to assure man a tranquil existence. Muhammad compared women to domestic animals and gave men permission to beat them (as does the Qur'an: see sura IV.34 above). Muhammad said in the Hadith that a wife must never refuse a husband his conjugal rights, even if it is on the saddle of a camel or even on a scorching oven. Muhammad is said to stand at the gates of hell, where he sees to it that the majority of those who enter it are women. Why? Because of women's ungratefulness to men.

Misogyny after Muhammad. It will be appropriate to include a quote on the subject of women from the famous and much-revered philosopher al-Ghazali (1058–1111), whom scholar Montgomery Watt described as the greatest Muslim after Muhammad. In his "The Revival of the Religious Sciences," Ghazali defines the woman's role thusly:

> She should stay at home and get on with her spinning, she should not go out often, she must not be well-informed, nor must she be communicative with her neighbours and only visit them when absolutely necessary; she should take care of her husband and respect him in his presence and his absence and seek to satisfy him in everything; she must not cheat on him nor extort money from him; she must not leave her house without his permission and if given his permission she must leave surreptitiously. She should put on old clothes and take deserted streets and alleys, avoid markets, and make sure that a stranger does not hear her voice or recognize her; she must not speak to a friend of her husband even in need. . . . Her sole worry should be her virtue, her home as well as her prayers and her fast. If a friend of her husband calls when the latter is absent she must not open the door nor reply to him in order to safeguard her and her husband's honour. She should accept what her husband gives her as sufficient. . . . She should be clean and ready to satisfy her husband's sexual needs at any moment.

The Sexes at the Bar of Justice. The inequality between men and women in matters of giving testimony or evidence or bearing witness in court is also enshrined in the Qur'an (sura II.282, quoted above). By taking the testimony of two beings whose reasoning faculties are faulty, we do not obtain the testimony of one complete person with a perfectly functioning rational faculty—such is Islamic arithmetic! By this logic, if the testimony of two women is worth that of one man, then the testimony of four women must be worth that of two men, in which case we can dispense with the testimony of the men. But no! In Islam the rule is not to accept the testimony of women alone in matters to which men theoretically have access. It is said that the Prophet did not accept the testimony of women in matters of marriage, divorce, and *hudud*. *Hudud* are the punishments set down by Muhammad in the Qur'an and the hadith for (1) adultery—stoning to death; (2) fornication—a hundred stripes; (3) false accusation of adultery against a married person—eighty stripes; (4) apostasy—death; (5) drinking wine—eighty stripes; (6) theft—the cutting off of the right hand; (7) simple robbery on the highway—the loss of hands and feet; robbery with murder—death, either by the sword or by crucifixion.

On adultery, the Qur'an says (sura XXIV.4): "Those that defame honourable women [that is, have sex with them] and cannot produce four witnesses shall be given eighty lashes." Of course, Muslim jurists will only accept four male witnesses. These witnesses must declare that they have "seen the parties in the very act of carnal conjunction." Once an accusation of fornication and adultery has been made, the accuser himself or herself risks punishment if he or she does not furnish the necessary legal proofs. Witnesses are in the same situation. If a man were to break into a woman's dormitory and rape half a dozen women he would risk nothing, since there would be no male witnesses. Indeed the victim of a rape would hesitate before going in front of the law, since she would risk being condemned herself and have little chance of obtaining justice. "If the

woman's words were sufficient in such cases," explains Judge Zharoor ul Haq of Pakistan, "then no man would be safe." This iniquitous situation is truly revolting, and yet for Islamic law it is a way of avoiding social scandal concerning the all-important sexual taboo concerning rape: in Islamic society the concepts of honor and shame predominate, and a woman who is raped brings shame upon her family, even though having been raped is not her fault. It is lawful for a man to kill his wife and her lover if he catches them in the act. Women found guilty of fornication were literally immured, at first; the Qur'an ordains: "Shut them up within their houses till death release them, or God make some way for them" (sura IV.15). This harsh doctrine was later canceled; mere stoning was substituted for adultery, and one hundred lashes for fornication. But even stoning is a very different affair when directed at a woman. When a man is to be stoned to death, he is taken to some barren place, where he is stoned first by the witnesses, then the judge, and then the public. When a woman is stoned, a hole to receive her is dug as deep as her waist—the Prophet himself seems to have ordered such procedure.

In the case where a man suspects his wife of adultery or denies the legitimacy of her offspring, his testimony is worth that of four other men. Sura XXIV.6 proclaims: "If a man accuses his wife but has no witnesses except himself, he shall swear four times by God that his charge is true, calling down upon himself the curse of God if he is lying. But if his wife swears four times by God that his charge is false and calls down His curse upon herself if it be true, she shall receive no punishment." Appearances to the contrary, this is not an example of Qur'anic justice or equality between the sexes. The woman indeed escapes being stoned to death, but she remains rejected by her husband and loses her right to her dowry and her right to maintenance, whatever the outcome of the trial. Further, no woman may accuse her husband in a similar manner. Finally, for a Muslim marriage to be valid, there must be a multiplicity of witnesses; Muslim jurists tell us that two men form a multiplicity, but not two, or three, or even a thousand women.

In questions of inheritance, the Qur'an tells us that male children should inherit twice the portion of female children:

> IV.11–12. A male shall inherit twice as much as a female. If there be more than two girls, they shall have two-thirds of the inheritance, but if there be one only, she shall inherit the half. Parents shall inherit a sixth each, if the deceased have a child; but if he leave no child and his parents be his heirs, his mother shall have a third. If he have brothers, his mother shall have a sixth after payment of any legacy he may have bequeathed or any debt he may have owed.

To justify this inequality Muslim authors lean heavily on the fact that a woman receives a dowry and has the right to maintenance from her husband. It is also true that according to Muslim law, no mother is obliged to provide for her children. To quote Bousquet, a twentieth-century Algerian expert in Islamic law, if a mother does spend money on her children, it is, "recoverable by her from her husband if he is returned to a better fortune as in the case of any other charitable person. Therefore there is no point in the husband and wife sharing in the taking charge of the household; this weighs upon the husband alone. There is no longer any financial interest between them."

This latter point simply emphasizes the negative aspect of Islamic marriage—that is to say, the total absence of any idea of "association" between "couples" as in Christianity. As to dowry, it is, of course, simply a reconfirmation of the man's claims over the woman in matters of sex and divorce. In any case, the dowry benefits the woman little as she is never able to use it for herself. The custom is either to use the dowry to furnish the house of the newly married couple, or for the wife to offer it to her father. According to the Malekites, one of the four orthodox Sunni schools of Islamic law, a woman can be obliged by law to expend her dowry in order to furnish the house. Muslim law also gives a woman's father or other guardian the right to cancel a marriage—even that of a woman of legal age—if he thinks the dowry is not sufficient. Thus the dowry, instead of being a sign of woman's independence, turns out once more to be a symbol of her servitude.

True, the married woman has the right to maintenance (that is, support), but this simply emphasizes her total dependence on her husband and the sense of insecurity which attends that. Muslim jurists have ruled that the husband is not obliged under Islamic law to pay for his wife's medical expenses in case of illness. Of course, financial independence for women would constitute a first step in the liberation of Muslim women; thus it is not surprising that it has been seen as a threat to male dominance.

Economic equality can sometimes be imposed if it imposes an equal *responsibility* on both sexes. Under Article 158 of Syrian law, Muslim women are now obliged to take equal responsibility for looking after their parents: "The child—male or female—having the necessary means is obliged to take responsibility for his or her poor parents."

The birth of a girl is still seen as a catastrophe in Islamic societies. The system of inheritance just adds to her misery and her dependence on some man. If she is an only child, she receives only half of her father's estate; the other half goes to the male members of the father's family, however remote these may be. If there are two or more daughters, they share between them two-thirds. This pushes fathers and mothers to prefer male children to female, so that they can leave the entirety of their effects or possessions to their own descendants. "Yet when a new-born girl is announced to one of them his

countenance darkens and he is filled with gloom," intones sura XLIII.17. The situation is even worse when a woman loses her husband—she receives only a quarter of the legacy. If the deceased leaves more than one wife, all the wives are still obliged to share among themselves a quarter or even, is some cases, one eighth of the legacy.

Male Superiority: A Matter of Muslim Law. Muslim jurists are unanimous in their view that men are superior to women in virtue of their reasoning abilities, their knowledge, and their supervisory powers. And since it is the man who assumes financial responsibility for the family, it is argued, it is natural that he should have total power over the woman. These same jurists, of course, totally neglect changing social conditions under which a woman may contribute her salary to the upkeep of her family—even here, power over women remains a divine command and is seen as "natural" or "in the nature of things." Muslim thinkers continue to confine Muslim women to the home—to leave the house is against the will of God and against the principles of Islam. Confined to their houses, women are then reproached for not having any experience of the outside world!

While Islamic scripture, law, and tradition stand unchallenged, women stand at the back of every line.

WOMEN AND UNBELIEF. Women in the Western world emerged as major players in the FREETHOUGHT movement by the end of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE). Eighteenth-century freethinkers who ventured to publish unorthodox views gambled with loss of liberty, wealth, and sometimes life. Women heretics had even more to fear. The last witchcraft trials and executions took place in the early 1790s. Against this backdrop—at a time when women were still at the mercy of the New Testament injunction, "Keep silence"—the strong activism of female freethinkers is impressive.

Early Women Freethinkers. One of the earliest female deists (see DEISM) on record was Caroline, queen of England, who was exempted at her request from taking the oath by an act of Parliament when acting as regent, and refused deathbed sacraments. Catherine the Great, empress of Russia, was a deist who corresponded with VOLTAIRE. Marquise du Châtelet, a scientist and Voltaire's companion of thirteen years, was likewise a deist whose essay "Doubts on Revealed Religions," dedicated to Voltaire, was published posthumously in 1792.

By the time the common woman began to proclaim unbelief two hundred years ago, women's legal status was still "civil death": they could not vote, speak in public, make contracts, sue or be sued, sit on juries, attend colleges or universities, enter most trades or professions, control their own property or earnings, or be legal guardians of their own children. Despite onerous religious, domestic, and legal handicaps, women unbelievers found their voices by the early nineteenth century, and began lecturing, leafleting, writing, founding freethinking societies, editing publications, and agitating to remove religious control from civil laws.

The history of female unbelief runs parallel with the history of woman's rights advocacy. The earliest women freethinkers were also the trailblazers for feminism, since it took unorthodox women to challenge the religious status quo. Women freethinkers were the first women to call for woman suffrage, legal equality, marriage and divorce reform, dress reform, sexual equality, birth control, and educational rights (see BIRTH CONTROL AND UNBELIEF; WOMAN SUFFRAGE MOVEMENT AND UNBELIEF; SEX RADICALISM AND UNBELIEF).

Mary WOLLSTONECRAFT published the first influential book advancing women's rights, *A Vindication of the Rights of Woman* (1792). The British Wollstonecraft was a child of the Enlightenment, a deist who espoused reason in everything she wrote. A prototype of the women who would follow in her footsteps, Wollstonecraft not only repudiated orthodoxy and espoused feminism, but was a reformer as well.

Freethinking Scottish-born Frances WRIGHT was the first woman to speak publicly from the podium before men and women in the United States; her stated purpose was to "destroy the slavery of the mind." On a historic lecture tour in 1828, she became the first woman in America to call publicly for women's equality. Wright termed churches the most formidable enemy of world progress. Advocating that people "turn their churches into halls of science," she herself purchased a church for seven thousand dollars in the Bowery district of New York, renamed it the "Hall of Science," and inspired others to do likewise. She and Robert Dale OWEN published the *FREE ENQUIRER* in 1829, making her the first female freethought editor in the United States.

American Women Freethinkers. Polish immigrant Ernestine L. ROSE became the first publicly declared female atheist in the United States and also the first woman to canvass for women's rights. In 1836 she began lobbying for the Married Woman's Property Act, introduced in the New York state legislature by freethinking Judge Thomas Hertell, which passed in 1848.

Rose lectured in at least twenty-three states, helping women obtain property rights. As an open atheist, she was often shunned, not only by clergy but sometimes by women's rights advocates, such as some participants at the Philadelphia woman's rights convention of 1854 who unsuccessfully tried to bar her from presiding because of her atheism. Rose was active in "infidel" and early freethought organizations. Her classic lecture "A Defense of ATHEISM" was delivered in Boston in 1861, and reprinted as a pamphlet by Josiah P. MENDUM of the *BOSTON INVESTIGATOR*.

Freethinker Elizabeth Cady STANTON launched the women's rights movement. With four Quaker women, Stanton, a harried young mother, organized the first women's rights convention in Seneca Falls, New York, in 1848, shocking friends and the world with her public call for woman suffrage. Stanton later recalled in *The History of Woman Suffrage* "that the greatest obstacle we had to overcome was the Bible. It was hurled at us on every side." Stanton devoted her life to freeing women from "the fountain of all tyranny, religious superstition, priestly power, and the canon law." It was a rare speech or article by the "fearless, serene agnostic" that did not contain a trenchant criticism of religion. Stanton founded and served as first president of the National Woman Suffrage Association. She was editor of the irreverent the *Revolution* (1868–70), and was much published in the freethought press, lecturing before many Liberal groups. Stanton was friendly with the freethinkers of her day, including Robert Green INGERSOLL and Charles BRADLAUGH of England. She edited *The Woman's Bible* (1895, 1896), a best seller at the time, which, though repudiated by vote of the suffrage association in 1898, has endured. Stanton outspokenly called the Bible the most degrading book ever written about women. Stanton's colleague Susan B. ANTHONY, a Quaker-turned-agnostic, defended Ernestine L. Rose and *The Woman's Bible*. Anthony pronounced her creed as "the perfect equality of women."

Matilda Joslyn GAGE, a nonreligious national suffrage leader, shared Stanton's passionate conviction that women needed to be freed from superstition. Gage authored *Woman, Church, and State* (1893) to refute the myth that women's status was improved under Christianity.

Freethinking rank-and-file activists in the suffrage movement included Lillie Devereux BLAKE, a freethinker who directed the New York State Suffrage Association, winning many "firsts" for women. Marilla M. RICKER was a trailblazing attorney who worked with Robert Green Ingersoll on his Star Route mail fraud cases and promoted suffrage and legal equality. Her two decades of pithy columns for the freethought newspaper *THE TRUTH SEEKER* were published in two books. Fifty years after Ernestine L. Rose helped pass the first property reform for women, Josephine K. Henry became the main force behind the tardy adoption of the 1894 Woman's Property Act in Kentucky. Henry was declared an undesirable member of the state suffrage association she founded when her two letters critical of the Bible appeared in *The Woman's Bible*.

Helen H. GARDENER, a writer and suffragist, wrote the eloquent *Men, Women and Gods* (1885). She had been dubbed "Ingersoll in soprano" while delivering a lecture series based on her book. This still-timely work critiques not only the Bible's treatment of women but such theological doctrines as vicarious atonement.

Voltairine DE CLEYRE, a freethinker, writer, poet, and anarchist (see ANARCHISM AND UNBELIEF), believed that it is better to have a religion of deeds than a religion of creeds. She believed that it is better to work for humanity than for a god. A strikingly modern thinker, de Cleyre was a radical on sex questions, as was her compatriot, anarchist Emma GOLDMAN (1869–1940), who agitated for birth control. In her journal *Mother Earth*, Goldman published two important essays on religion, "The Failure of Christianity" (1913) and "The Philosophy of Atheism" (1916). Radical Lucy Parsons—widow of the freethinking martyr Albert Parsons, who was hanged as a scapegoat for the Haymarket riot—fought not only racism, but was a labor activist dogged by the FBI. Her journals, *Freedom* and *Liberator*, were peppered throughout with her freethought views.

Margaret SANGER began her crusade to bring contraception to women by launching a 1914 newspaper, the *Woman Rebel*, with the motto: "No Gods—No Masters." Arguably doing more than any other individual to free women, Sanger fought the power of the Roman Catholic Church in her lifelong campaign. In her 1938 autobiography, Sanger explained her goal to make every woman a rebellious Vashti, not an Esther (a wry reference to the Old Testament Book of Esther).

Charlotte Perkins GILMAN, an internationally known feminist, author, editor, and theorist, pulverized "death-based religions" with her highly original book, *His Religion and Hers: The Faith of Our Fathers and the Work of Our Mothers* (1923). Gilman noted that the human species was misdirecting its best efforts toward the sky. Rejecting the Genesis idea that work was a curse, Gilman believed work was humanizing, and would rescue women consigned by religion to be a servant class to men.

Among other important nineteenth-century American women freethinkers and critics of religion was Lydia Maria CHILD, author of *The Progress of Religious Ideas through Successive Ages* (1855). (Child was more anti-theology than pro-freethought.) Margaret Fuller was a pioneering journalist, editor, and thinker whose motto was: "Give me truth; cheat me by no illusion." Ella E. GIBSON wrote for most of the nineteenth-century freethought publications, and produced the first book analyzing the Bible and women, *The Godly Women of the Bible, by an Ungodly Woman of the Nineteenth Century* (1878). Elmina D. SLENKER likewise wrote for

freethought periodicals. Her book *Studying the Bible* was published in 1870. Etta SEMPLE, a progressive reformer, cofounded the Kansas Freethought Association, served as its president, and published *Freethought Ideal* from her parlor.

French Women Freethinkers. Olympe de Gouge, a political pamphleteer during the French Revolution, issued her short manifesto "Declaration of the Rights of Women" in 1791. The document referenced a supreme being in the deistic sense. Gouge wrote that "the tocsin of reason is being heard throughout the whole universe," dispersing "fanaticism, superstition." Gouge died by the guillotine. Despite her early cry for liberty, French women, like those in Germany and Britain, were a generation behind American women in organizing for their rights. A founding member of the feminist movement, Maria Deraismes was a comedic playwright. Deraismes welcomed participants to the first French Women's Congress, held in 1878, and was president of the Society for the Improvement of the Condition of Women. A rationalist, she was the first woman Freemason in France and directed several freethought societies. She was a copresider of the Anti-Clerical Congress in Paris in 1881 (see ANTICLERICALISM).

British Women Freethinkers. Among the British freethought movement's many women champions was Harriet MARTINEAU, the prominent author, abolitionist, reformer, feminist, and translator of Auguste COMTE into English. Martineau recoiled from theology. In her *Autobiography* (1877), she decried "the superstitions of the Christian mythology" and noted how "dogmatic faith compels the best minds and hearts to narrowness and insolence."

Emma MARTIN was an early lecturer and pamphleteer for freethought. A feminist and a friend of secularist George Jacob HOLYOAKE, she wrote an autobiographical pamphlet about rejecting religion titled "A Few Reasons for Renouncing Christianity and Professing and Disseminating Infidel Opinions." Martin's observation in "Renouncing Christianity" could summarize the leitmotif of feminine freethought: "Religion, with an upward glancing eye, asks what there is above. Philosophy looks around her and seeks to make a happy home of earth."

Barbara Leigh Smith Bodichon, another colleague of Holyoake, wrote a summary of laws concerning women in 1854. That work became a major catalyst of the British feminist movement and resulted in the adoption of the Married Women's Property Bill in 1857. Bodichon, who had met Elizabeth Cady Stanton, was inspired to petition Parliament for suffrage (though she did not succeed).

Harriet LAW worked for secular causes for thirty years and briefly edited the *Secular Chronicle*.

Annie BESANT, the professional partner of atheist leader Charles Bradlaugh in the NATIONAL SECULAR SOCIETY, was a famed freethought orator during the 1880s. Besant, with Bradlaugh, challenged the Obscene Publications Act by reprinting *The Fruits of Philosophy*, hastening the birth control movement (see KNOWLTON, CHARLES). Besant was a capable propagandist on freethought topics until her conversion to mysticism and THEOSOPHY in 1889.

Bradlaugh's daughter Hypatia Bradlaugh BONNER carried on after her father's death in 1891, starting a freethought publishing house, editing the *Reformer* (1897–1904), cofounding the RATIONALIST PRESS ASSOCIATION, and writing several freethought books, including *Christianity and Conduct* (1919). Bonner worked against the death penalty and BLASPHEMY laws, founded the Rationalist Peace Society in 1910, and was honored by London authorities for nearly half a century of public service.

Women and State/Church Advocacy. While Roger WILLIAMS is credited with the honors, it was in fact a woman, Anne Hutchinson, who was the first to found a colony establishing religious liberty in the New World. Hutchinson emigrated to the Massachusetts Bay Colony of Boston in 1634. Branded an "American Jezebel" for holding theological discussion groups in her home for women and attracting male followers to her Quaker-like opposition to Puritanism, Hutchinson was banished for sedition and heresy in 1637, then excommunicated. She and her doomed followers settled on an island in their short-lived Rhode Island colony, where they adopted the first declaration of religious freedom: "It is ordered that none shall be accounted a delinquent for doctrine." The colony was wiped out by an Indian tribe under Puritan influence.

An eccentric American defender of the Enlightenment, the outspoken Anne Newport ROYALL attacked the "Christian party in politics" and Sabbatarians (who sought to end postal delivery and force businesses to close on Sunday), who were coming to power in the 1820s. Royall, the first lobbyist to monitor the separation of church and state in Congress, fought to retain Sunday mail delivery, single-handedly destroyed Sunday school Union tracts left in the Library of Congress, and personally drove missionaries from the halls of Congress. The Baltimore-born deist was arrested and convicted of being a "common scold" in 1829. Undaunted, Royall launched the weekly watchdog journals *Paul Pry* (1831–36) and the *Huntress* (1836–54). Royall's motto: "Good works instead of long prayers."

In 1890 Matilda Joslyn Gage organized a short-lived women's organization to support church-state separation, the Woman's National Liberal Union, warning of the dangers to women and to liberty posed by "The Christian Party in Politics" seeking a union of church and state.

Vashti MCCOLLUM won the first challenge against religious instruction in public schools in a US Supreme Court case handed down in 1948. She wrote *One Woman's Fight* (1951) about her family's ordeal in taking up the landmark challenge. Active in humanist and freethought groups, McCollum served two terms as president of the AMERICAN HUMANIST ASSOCIATION.

Contemporary Women Unbelievers. The two most prominent national US atheist/agnostic membership organizations in the late twentieth century were both founded by women.

American Atheists was launched by Madalyn Murray O'Hair. O'Hair, born Madalyn Mays in Pittsburgh, came to prominence by winning a lawsuit challenging Bible reading and recitation in Baltimore's public schools. Her lawsuit, *Murray v. Curlett*, was joined to the major 1962 decision *Schempp v. Abington*, which ruled such religious rituals unconstitutional. O'Hair and the media concurred at the time that she had become "the most hated woman in America" for her outspoken, often vulgar attacks on religion. Controversial as she was, O'Hair was undeniably the best-known atheist in the United States. Her organization, headquartered in Austin, Texas, published periodicals, reissued a number of freethought books, and produced a radio series. She, her son Jon Garth, and granddaughter Robin were tragically murdered by a former employee/embezzler in 1995. The case was solved several years after their disappearance. Ellen Johnson, a New Jersey activist, now directs American Atheists from New Jersey.

Anne Nicol Gaylor established the Freedom From Religion Foundation as a national group in Madison, Wisconsin, in 1978, serving as its president through 2004. The foundation has grown to more than seventy-six hundred members nationwide, launched the newspaper *Freethought Today*, published several books and films, and has become a major litagator to keep church and state separate. Gaylor, a nontheist since childhood, followed the footsteps of many nineteenth-century predecessors by becoming a freethought activist after her interest in feminism made her aware that the root cause of women's oppression was religion. Belying the myth that atheists don't found charities, she has run the Women's Medical Fund as a volunteer since 1972. It is the longest-lived US abortion rights charity, and has helped more than sixteen thousand indigent women exercise their right to abortion despite constant attack by religionists.

Women's leadership has likewise been prominent in Great Britain. Psychologist Margaret Knight became a national celebrity when she delivered a freethought lecture series over BBC radio in 1955, collected in book form as *Morals without Religion*. Barbara Smoker was president of the National Secular Society, founded by Charles Bradlaugh and Annie Besant, from 1971 to 1996.

Noted Women Unbelievers. Significant US freethought writers include Russian-born naturalized citizen Ayn Rand, an atheist, founder of the Objectivist movement, and a best-selling novelist; Ruth Hurmence Green, author of *The Born Again Skeptic's Guide to the Bible* (1979); Barbara G. Walker, author of *The Skeptical Feminist* (1987); writer and social critic Barbara Ehrenreich, an atheist who has written regularly for *Time* magazine; Katha Pollitt, atheist, poet, and columnist for the *Nation*; and Wendy Kaminer, agnostic, social critic, and commentator. Mormon-turned-freethinker Sonia Johnson, author of *From Housewife to Heretic* (1983), became a freethinker after being excommunicated by the Mormon Church in 1979 for exposing that church's role in sabotaging the proposed Equal Rights Amendment to the US Constitution.

Freethinking novelists and playwrights include Margaret Atwood, Pearl S. Buck, Simone de Beauvoir, Isak Dinesen, George Eliot, Zona Gale, Zora Neale Hurston, Lorraine Hansberry, Ursula K. LeGuin, Doris Lessing, Robin Morgan, Joyce Carol Oates, Ouida, Olive Schreiner, Madame de Stael, Alice Walker, and Virginia Woolf.

Freethinking poets include Louise Victorine Ackermann, Amy Lowell, and Gertrude Stein.

Freethinking artists include Marie Bashkirtseff, Rosa Bonheur, Margaret Bourke-White, Isadora Duncan, Kate Greenaway, and Frida Kahlo.

Scientists include Marie Curie.

Entertainers include actress Marlene Dietrich, singer Ani DiFranco, actress Frances Farmer, actress Jodie Foster, actress Katharine Hepburn, actress Butterfly McQueen, and actress/comedian Julia Sweeney.

Believers in This World. The history of women in freethought is singularly the history of activists working to improve conditions in this, the only known world. Proof of the continuing threat posed to women's liberty by fundamentalists is Bengali physician and author Taslima Nasrin. The outspoken atheist wrote of the plight of women in the Muslim world. She fled her country in 1994 and went into hiding after being condemned to death for blasphemy by her country's "holy men." Nasrin is proof also of the new wave of feminism and freethought washing over non-Christian nations, as women find the courage to speak out against the greatest enemy of women and liberty under whatever guise: fundamentalism.

WOOLSTON, THOMAS (1669/1670–1731/1733), English deist. A passionate deist (see DEISM) critic of revealed religion, Thomas Woolston has been described by one contemporary apologist as an "evil genius." Thomas Woolston was born in Northampton, England. A studious young man, he studied theology at Sidney Sussex College, Cambridge, and embarked on a career in the Church of England. His studies of early Christianity led to an appreciation of the allegorical modes of biblical interpretation then frequently employed, particularly by the ancient church father Origen, whom Woolston particularly admired. But Woolston took this several steps further than Origen would have countenanced, and quickly moved to an advanced deist viewpoint.

His first significant work was *Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived* (1705). From then on, Woolston was under suspicion for being dangerously unorthodox, which a new series of letters and pamphlets in 1720 and 1721 did nothing to ease. In 1721 he lost his fellowship at Sidney Sussex College and moved to London, where he survived on the support of his brother. In *The Moderator between an Infidel and an Apostate* (1725), Woolston entered controversial territory once more with a measured criticism of Anthony COLLINS (the infidel) and, more riskily, the established church (the apostate). In his role as the moderator, Woolston once more argued for the allegorical interpretation of scripture and against a literal reading of miracle stories and the resurrection of Christ. He developed his moderator device in a series of six *Discourses on the Miracles of Our Savior*, published between 1727 and 1730. As if the subject matter of the *Discourses* was not sufficiently incendiary, Woolston's notional moderator was a rabbi. The *Discourses* were devoted primarily to questioning the resurrection of Christ, miracles, and other supernatural elements of the gospels. The *Discourses* sold very well and attracted about sixty written replies.

This was too much for the church, which struck back late in 1729. Woolston was fined twenty-five pounds for each of the first four discourses and was to be imprisoned until the fines were paid. Not having access to that sort of money, and refusing to desist from further writing, Woolston remained incarcerated until his death. His date of death is uncertain, the most likely being January 21, 1731, though others have suggested January 21 or 27, 1733.

Woolston's posthumous reputation has been uneven. Friends and foes alike have long suspected a certain imbalance in his personality. His writing was pugnacious and sarcastic and he was unusually sensitive to criticism, of which he received a great deal. However, his conclusions were no more radical than most of his deist contemporaries.

BILL COOKE

WRIGHT, ELIZUR (1804–1885), American atheist and abolitionist. Elizur Wright's emergence as a leading American freethought advocate during the 1870s was the logical outcome of his career as a radical abolitionist and life insurance reformer. His journey across the nineteenth century embodied the secularization and rationalism of the period, culminating in his rejection of church and creed.

Early Life. Born on February 12, 1804, in South Canaan, Connecticut, Wright was the eldest child of his father's second marriage. His yeoman parents, who moved to the Western Reserve of Ohio in 1810, were devout Congregationalists. His father was a Yale graduate, deacon, and frontier schoolmaster, while his mother, Clarissa (née Richards), stressed piety. Groomed for the ministry, Wight attended his father's alma mater from 1822 to 1826, where he displayed a paternal talent for mathematics and science.

Lack of funds, a love affair, and persistent qualms about a clerical calling led the young Wright to conflicted career choices. He resolved his quandary by marrying Susan Clark in 1829. In lieu of the ministry, he accepted a professorship of mathematics and natural philosophy at Western Reserve College in Hudson, Ohio. In 1832 and 1833 Wright and his colleagues Beriah Green and Charles B. Storrs transformed the college into a center of radical abolitionism. Convinced by the passionate arguments of William Lloyd Garrison, the Boston editor of the *Liberator*, the threesome denounced the moral expediency of repatriating African Americans to Liberia. Instead they demanded immediate emancipation and equal rights for blacks. (Fellow abolitionist minister John Ingersoll paid tribute to Beriah Green by making him the "middle-namesake" of his own son—the future orator and "Great Agnostic" Robert Green INGERSOLL, born in 1833.)

Reform Career. In 1833 Wright accepted the position of secretary of domestic correspondence of the American Anti-Slavery Society, a New York City posting that placed him in the vanguard of the movement. For the next six years, he displayed his organizational and literary talents, aided fugitive slaves, and argued for racial justice. A white backlash against abolitionism provoked Wright to caustic criticism of Christian hypocrisy. By 1840 factionalism among abolitionists found Wright in the forefront of political action in Boston, editing abolitionist papers such as *The Massachusetts Abolitionist*

and *The Chronotype*. Caught in economic hard times and with a large family to support, Wright published a translation of La Fontaine's *Fables* (1841) and found gainful work consulting for life insurance companies. His mathematical talents and reformist zeal made him America's leading actuary at midcentury. He rationalized actuarial science and relentlessly ferreted out fraud as a pioneering commissioner of life insurance in Massachusetts from 1858 to 1867. Outraged by the repressive Comstock Act (1873) (see COMSTOCK, ANTHONY, AND UNBELIEF), Wright championed freethought along with Robert G. Ingersoll, Francis E. ABBOT, D. M. BENNETT, and Erza HEYWOOD. He served as president of the NATIONAL LIBERAL LEAGUE in 1879 and 1880. He died at Medford, Massachusetts, on November 21, 1885.

LAWRENCE B. GOODHEART

WRIGHT, FRANCES (1795–1852), American freethinker, abolitionist, and sex radical. Born in Scotland of wealthy, intellectual parents, Frances Wright became one of the most despised women of the nineteenth century. Orphaned before she was three and raised by an aunt in southern England, Wright returned to Scotland when she turned eighteen. There, surrounded by supportive mother surrogates and brilliant men closely associated with the Scottish Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), Wright wrote tragic drama and a treatise on Greek philosophy.

In 1818 Wright and her sister Camilla traveled to America for a successful tour that inspired her to pen *Views of Society and Manners in America*, which would become her most popular book. Like her great-uncle James Mylne and her great-great-uncle John Millar, Wright advocated for the education of women and was fervently opposed to the slave trade. Seeing slavery for the first time on this trip, she brought the fresh perspective of a young woman's horror to this old American problem.

Returning to England in 1820, Wright, an attractive, well-connected, and outspoken young woman with a brilliant mind, formed friendships with two of the most important men in Europe—Jeremy BENTHAM and General Lafayette. Wright's relationship with Lafayette, much written about today, was complicated. From the moment she first met him—she went uninvited to his chateau in France—she encouraged a passionate relationship, much to the horror of his family. Wright proposed to him, then suggested that he adopt her as his legal daughter. Their intimacy, whether that of friends or lovers, helped give her more intellectual confidence as she imagined grand schemes for liberating the world.

Returning to the United States in 1824 to follow Lafayette as he traveled across the country, Wright was in Washington, DC, in February of 1825 when Robert OWEN spoke to Congress on his plan to create a "community of equality" in southwestern Indiana. This was New Harmony; visiting it twice in the spring of 1825, Wright decided to create an intentional community where slaves could "work out" their freedom, while at the same time they and their children could become educated and prepared for life as free men and women. Wright was not interested in plans she had heard of to simply send slaves to Haiti. Her fascination with Owen's notion of communal life was that it promised a way for poor, landless people to benefit from their own labor.

Encouraged by Lafayette, Wright advertised the community that would become Nashoba in the abolitionist journal the *Genius of Universal Emancipation* in October of 1825. Located outside of what is now Memphis, Tennessee, Nashoba spelled out women's rights and slaves' rights more explicitly than at any other nineteenth-century community. Yet the community was immediately plagued with too little money, too little food, and too much to do to maintain civilized life in the middle of "the west."

During her first summer in Tennessee in 1826, Wright became ill with fever—probably malaria—and her illness forced her to leave for Europe to convalesce the following year. As she was sailing to Europe, one of the white men in the community gave a copy of the "Nashoba Book" to a journalist to publish. It included a significant piece of information: that the while male member and a young, attractive black woman had begun living together. With the publishing of the "book," public outrage against Wright's "free-love colony" sprang up all over the country, destroying Wright's reputation.

In 1828 Wright realized that she cold not convert "the existing generation" to her plan and began to focus instead on writing and lecturing. Along with her friend Robert Dale OWEN, son of Robert Owen, Wright took over the editorship of the languishing *New Harmony Gazette*, renamed it the *FREE ENQUIRER*, and moved it and herself to New York City. From that base, Wright lectured and wrote on the importance of equal rights for women—and of how "priests," those "hired supporters of error," encouraged mental bondage for women. Wright's frank discussion of the "unnatural" sexual restraints upon women and the unnatural social limitations upon blacks inspired fury throughout the United Stated. Everyone criticized her, even her former friends.

In the midst of her writing and lecturing career, Wright decided to free the Nashoba slaves by removing

them to Haiti. In October of 1829, she and William Phiquepal, another Owenite reformer who was familiar with the West Indies, sailed to Haiti with the slaves. During this trip, Wright became pregnant and the direction of her life changed forever. Wright married Phiquepal in 1831 when their daughter, Sylva, was over six months old, but domestic life (and a bad marriage) isolated Wright during the early 1830s. Returning to the United States in 1835, Wright attempted to regain her position as a public lecturer and writer, but could not. During the last years of her life, Frances Wright battled Phiquepal for her property and for her daughter, who, living with her father, primarily sided with him. Wright died in Cincinnati at age fifty-seven, alone and crippled from a fall that broke her hip.

The example of Frances Wright speaks powerfully to us today. Although her friends and colleagues all turned against her (even Robert Dale Owen summed up his work with her as "immature and extravagant"), Wright never stopped writing and speaking for women's equality and never stopped criticizing the society that created and perpetuated secondary citizenship for women. Whereas Robert Dale Owen "grew up" and denounced his former reform, Wright, to her credit, never repented.

CAROL KOLMERTEN

WRIGHT, RICHARD (1908–1960), American novelist and humanist. One of black America's greatest and most influential authors, Richard Wright was born on a plantation near Natchez, Mississippi. He and his family lived there for the first five years of his life. When he was six, the family moved to Memphis. Soon thereafter, his father abandoned the family for another woman. Later Richard and his mother moved to Jackson, Mississippi.

Wright's grandmother was a deeply religious Seventh-Day Adventist. She sent him to a Seventh-Day Adventist school near Jackson. He was later enrolled in a public school and developed a love of writing.

In 1927 Wright moved to Chicago. He met H. L. MENCKEN and read his material, as well as the works of Sinclair LEWIS and other religious skeptics. In 1937 he moved to New York City and became Harlem editor of the Communist publication the *Daily World.* In 1940 he wrote his masterpiece, *Native Son*, which became a best seller and international sensation. In 1944 he became disillusioned with the Communist Party and left it.

In 1945 he wrote his autobiography, *Black Boy: A Record of Childhood and Youth.* In 1946 he moved to France and became a friend of Albert CAMUS, Jean-Paul SARTRE, and Simone de BEAUVOIR. He read writings by such thinkers as Heidegger and became an existentialist (see EXISTENTIALISM). In 1953 he wrote his second novel, *The Outsider*, widely believed to be the first existentialist novel written by someone born in North America (not by an American, as Wright had become a naturalized French citizen in 1947).

The Outsider deals with a posttheistic world. However, Wright—like Sartre—did not believe that human beings could be trusted to produce a workable ethical system. Like C. L. R. JAMES, Wright did not believe in God, but he was also suspicious of human-centered belief systems. After all, both men had been disillusioned with atheistic communism.

Wright is generally recognized as one of the most important writers in American history. His brilliant ideas on the relationship of the individual to society and human destiny have made him one of the most talked-about writers of the twentieth century.

NORM R. ALLEN JR.

XENOPHANES OF COLOPHON (ca. 560–ca. 478 BCE). Greek poet and thinker. Driven from his native city by a Persian invasion around 546, Xenophanes wandered Greece as an itinerant rhapsode, a poet in the Homeric mold who recited for his supper in a succession of royal courts. As a very old man, he settled in Elea on the western Italian coast. There he presumably composed his more philosophic works and laid early foundations for the Eleatic school of philosophy, whose actual founder is held to be Parmenides.

The works of Xenophanes survive only in fragments, the only sources for his life or his thought. Like his predecessors Thales, Anaximander, and Anaximenes, Xenophanes was a monist. He taught the absolute unity of all things, denying any distinction between matter on the one hand and spirit or the life principle on the other. He argued that God, too, was unitary—and moreover that God was one with the universe. While apologists portray him as an early monotheist, Xenophanes was more accurately a pantheist.

Such a view was equivalent to ATHEISM by the standards of the time; had Xenophanes resided in Athens like PROTAGORAS or, later, SOCRATES, he might have suffered exile or worse as they did. His travels and his sojourn in Elea offered Xenophanes more freedom. He relentlessly criticized Greek popular religion for its naive anthropomorphism: "Mortals suppose that the Gods are born, and wear a man's clothing, and have voice and body. But if cattle or lions had hands, so as to paint with their hands and make works of art as men do, they would paint their

Gods and give them bodies like their own—horses like horses, cattle like cattle." He ridiculed the immoral behavior of the gods of Olympus, claiming that Homer "attributed to the Gods all things that with men are of ill-fame and blame" and "told of them countless nefarious things." Prefiguring other traditions of interest to freethinkers, Xenophanes denied the efficacy of divination and was the first Greek thinker to recognize fossils as historical records of bygone forms of life.

TOM FLYNN

ZELENSKI, TADEUSZ (BOY; 1874–1941), Polish iconcolastic commentator, literary critic, theater critic, and translator of masterpieces of French literature. Tadeusz Zelenski's articles and columns appeared between World War I and World War II, mainly in the weekly *Wiadomosci Literackie* (Literary News). In 1928 he started his great campaign for modernization and secularization of traditional culture, opposing the aggresive clericalism that he described in his book *Nasi okupanci* (Our Occupiers, 1932). In *Dziewice konsystorskie* (Consistory Virgins, an ironic reference to wives declared unmarried by an ecclesiastical court, 1929), *Pieklo kobiet* (The Hell of Women, 1930) and *Jak skonczyc z pieklem kobiet* (How to End the Hell of Women, 1932), he described varied manifestations of sex discrimination and demanded women's right to abortion. While brutally attacked by the Catholic and nationalistic press, he enjoyed great prestige among the Polish liberal intelligentsia of this period.
